

Chapter 1 : Dethatcher Vs. Aerator | eHow

Sears carries lawn aerators that deliver precious oxygen to the soil. Dispatch tough thatch with a durable dethatcher.

To achieve a truly vibrant, green and fully healthy landscape, you have to use a number of other tools to combat sometimes-unseen troubles such as poor drainage or mold growth around the roots. Dethatchers and aerators both work on these subtler lawn troubles, but perform very different tasks in the quest for a healthy lawn. **Video of the Day Thatch** Thatch is a layer of dead grass, roots, leaves and debris that accumulates at the base of your lawn over time. It builds up from falling leaves or mowing without raking afterward. Thatch also provides a breeding ground for insects. **Dethatching** Most lawns need dethatching every other year, in the early spring for warm-season grasses and in early to mid fall for cool season grasses. A dethatcher, also known as a vertical mower, features vertical blades instead of the traditional horizontal blades of a lawn mower. As you work across the lawn, the knives slice up the thatch and pull it up away from the soil and to the top of the lawn. Mow in one parallel direction, and then run the dethatcher perpendicular to your original path. Set the blades so that they tear up at least the top half of the thatch layer. Rake up the thatch you chop up and dispose of it like you do leaves in the fall. **Soil Thickness** All dirt is not created equal, and the thickness of the soil in your lawn can have a serious affect on the health of your grass and plants. Thick soil, especially clay soil, is slow to absorb water and nutrients, often leaving plants suffering from lack. This type of soil can also lead to flooding and, as the water sits on the surface instead of sinking into the soil, become a breeding ground for mosquitoes and other insects. **Aeration** An aerator is a tool that penetrates the soil, creating small holes that allow food and water to sink through even the thickest soil and into the roots of the plants. The holes also encourage more airflow around the roots to prevent mold buildup. Lawns should be aerated generally once per year in late summer or early fall , though some with extremely thick soil or inches of thatch buildup may need it twice per year. Always aerate on moist, but not soaked, soil. The small pieces of removed soil can be raked away or simply left on the surface to naturally break apart with rain and watering. **Finding the Tools** You can rent or purchase both dethatchers and aerators from garden centers and home improvement stores. You can also hire a professional to do the job for you, if you are unsure about how to properly use the tools. If you have any questions, consult a professional before you accidentally harm your landscape.

Chapter 2 : Spreaders, Sprayers, Dethatchers and Aerators - Lawn & Landscape

Aerators & Dethatchers. Aerators and dethatchers represent an important facet of any complete turf-care regimen, relieving soil compaction and thatch issues that can leave grass starved of oxygen, water, and nutrients.

Almost every year, Americans buy around 3. First of all, you have to understand the benefits of dethatching your lawn. This is very important because, if you have no idea about dethatching your lawn then you will not be able to pick the best one. When dethatching, you must be aware of your lawn because this is very important for your lawn health. If you have no idea about dethatching, then compare it with combing. In combing, you have to comb out debris from your lawn. This machine makes your lawn perfect and beautiful. The first thing to consider when buying a lawn dethatcher machine is a comfort. However, it is very important that you consider comfort before anything else. Examine hand positions, moving features, wheels, and anything that can enhance comfort. The next point is longevity and durability of your machine. Build quality is an important thing you should look for in a lawn dethatcher. Have a look at the main body and motor. Choose The Perfect Dethatcher Machine You might be interested in buying a model that is convenient for tidying up small lawns, or a more powerful mower machine that is capable of cleaning long grass in a large yard. Another consideration is your physique, specifically your height. There are some models on the market fitted with adjustable height handles, and that feature makes them more flexible and comfortable to use. There are some models those are best for sloppy areas and easy to maneuver in areas with trees or a small pond. Look of your lawn that you want to see is also important. You may be happy with small grass or want a more decent striped look. In terms of blade style, there are three types of lawn dethatching machine available on the market. One is cylinder machines fitted with a rotary blade at the front, specially designed for cutting grass in a scissor motion. If you have a lawn that needs to be cut more often then, this is the perfect pick for you. However, this is not recommended for those who have a lawn that has uneven surface or dump and long grass. Hover dethatchers are the most ideal for overhanging shrubs and unsuitable for small sized lawns. You can choose one that collects the thatch after the cutting process; it contains a bag for picking up afterward. It is cheaper than the cylinder or rotary models. And lastly, rotary dethatchers are fitted with a blade underneath that allows you to finish the work within a few rounds. Top 10 Lawn Dethatcher Machine of The lawn dethatching machine market is currently occupied by different brands. They have the good build quality and offer various features. However, different people have different choices. And finding the best match for your need is not that easy. The 10 products that we have selected here are definitely the best lawn dethatcher on the market in. You can always depend on any of them. Another point I should mention that these are not ranked in terms of any order; all of them deserve to be on this list. However, due to the format of this article, we arranged them like this. The GreenWorks dethatcher is an electric dethatcher. You want a machine that will get the job done quickly and efficiently. The Greenworks electric corded dethatcher removes the thatch layer with smooth operation and less noise. The 3-position tine depth adjustment provides great control and promotes continued lawn health. It comes with a robust 10 Amp motor which supplies power to the dethatcher. The inch dethatching path enables you to cover a larger area, allowing you to get the job done in less time. Customer like it and the reviews have been very positive for this GreenWorks dethatcher.

Chapter 3 : Lawn Dethatcher vs Lawn Aerator - www.nxgvision.com

Keep your lawn healthy and thick with lawn aerators and dethatchers. If you want a lush lawn, then a lawn aerator and dethatcher should be a part of your maintenance routine. A pull behind aerator attaches to the back of your tractor or riding motor.

The tool resembles a large rake. It is used to extract thatch lodged between the grass blades and soil. Thatch is often created from accumulated debris, grass clippings and fertilizers. When you dethatch your lawn frequently, it enhances the health and appearance of the lawn. A lawn aerator is also useful in lawn maintenance. The tool is used to create holes in the ground. This enables better infiltration of air, water and nutrients into the ground. With better distribution of these elements, the health of the soil is enhanced which also improves the lawn. A comparison of both tools is given below.

Lawn Dethatcher Advantages A power rake is a high efficacy tool in the removal of thatch. This is enabled by multiple sets of blades which spin vertically as they strike the ground. The rake then combs out the thatch but leaves the lawn in place. The heavy weight of the machine adds to its capacity to rake well. A power rake works better than an aerator when you need to improve the overall appearance of your lawn. This is due to its high level rake capabilities. The power rake enables you to achieve better results when you fertilize. This is because the power rake clears old organic matter very efficiently. The rotating blades of the rake can be adjusted depending on the amount of thatch you wish to extract. You can also use the power rake to weed your lawn. This adds to the versatility of the tool.

Disadvantages Dethatchers are operated by an engine. When heavily taxed, the wear and tear increases. Engine breakdowns will result which necessitate repair or replacement of the tool. The tool is composed of various moving parts such as engine, pulley and blades which necessitates frequent care. This makes power rakes high maintenance tools. Dethatchers are also heavyweight machines. They weigh about twice as much as the average lawn mower.

Lawn Aerators Advantages Aerators are much lighter than power rakes. This contributes to their ease of use and lower fatigue levels. The lightweight nature of aerators also adds to ease of storage. Various models of aerators abound on the market. This gives consumers a wide variety to choose from. Whatever model you pick, the design of aerators is generally simple. This is because the tools are assembled from fewer parts than dethatchers. Aerators are also low maintenance tools. This contributes to a higher durability for aerators compared to dethatchers. The tools also necessitate more time when used on the lawn due to their lower power capacity. If you have a large yard, you must plan for ample time to do aeration. Dethatchers however perform their job a lot faster. Photo copyright Wikimedia Commons [http:](http://)

Chapter 4 : Introduction To Best Lawn Dethatcher - Lawn Dethatcher Reviews

Turf aerators, lawn dethatchers, tillers and other tractor attachments are essential equipment if you want a lush grassy property. Aerators improve drainage by allowing air and water into the soil, and dethatchers clear dead leaves and other organic materials that have built up over time.
