

Chapter 1 : everything you need to know

Everything You Need to Know about Dinosaurs is packed with images, games, size comparisons, timelines, a glossary, an index, and more that will satisfy the curious minds of dinosaur-crazed kids, and be a trusted source for parents wanting to introduce their young readers to the world of dinosaurs.

Not everything is unlocked from the start, however, forcing you to play through the main campaign to unlock unique dinosaurs and features to create the park of your dreams. These resources are limited, however, so consolidating your money on things that will attract visitors to your park is vital to proceeding through the game. Focus your money mainly on dinosaurs to start. Find new ones from fossils by sending your researchers out on expeditions and tightening park security with a Ranger Station. Once you have a reliable source of income, construct hotels, shops, and other buildings that can generate more money to keep your park profitable. You can start an expedition to find fossils at any time by creating an Expedition Center in any of your parks and clicking on it. Then simply open the Expedition Map and choose a location. Your team will then go away for awhile and come back a few minutes later with fossils. After reaching a 50 percent genome score, you can incubate one of your newly-found dinosaurs at any Hammond Creation Lab. Just be sure not to mix herbivores with carnivores, unless you want to see your new dinosaurs fighting and killing one another. Make sure dinosaurs are secure and have everything they need. Image via Frontier Keeping your dinosaurs secure is as important as keeping them safe and healthy. Velociraptors, for example, are known for breaking out easily and causing chaos. To get around this, it might be best to double-fence some dinosaurs with an electric fence as the main barrier and a larger, more-durable fence just after it. That way, if one fence falls, you have a second there to keep your guests alive, which gives your rangers ample time to go in and repair it. Each one will have specific foods and environments that they need in order to live a peaceful life. Also, be sure to keep an eye on your feeders and replenish them often. Your guests are the main source of income for your park, so making sure they have everything that they need, such as viewing platforms to see the dinosaurs, hotels to stay in, and shops to buy things from, is vital to keeping your park in business. How to unlock Sandbox Mode is Jurassic World Evolution You should also be sure to build safety areas for your guests depending on what type of dinosaurs you have, and what the weather on the island is like. Storm-protecting structures and emergency shelters for your guests to hide in when a dinosaur is on the rampage are also vital to success. Invest, research, and prepare for the future. Image via Frontier Jurassic World Evolution is a game about progress. You start with the bare minimum of resources, dinosaurs, and features, and as you progress, you slowly unlock more things that give you the complete Jurassic Park experience. As you begin to build a nice pool of money, constantly have your researchers at dig sites to find as many fossils as possible and keep researching every structure and upgrade when a research team becomes available. All of these upgrades and tools may not seem vital at first, but the further you go into the game, the more it helps to be prepared for any situation that might unfold. If you do all of this, you can make a Jurassic Park that even John Hammond would be proud of.

FDA approves new weight-loss drug Qsymia Drs. Siegel and Samadi explain The worldwide fight against obesity may have just gotten easier. The FDA approved two new weight-loss medicines: Until recently, there was a year stretch in which the FDA did not approve any new medications to help people struggling with obesity. It is manufactured by the pharmaceutical firm Vivus, Inc. How does Qsymia work? As I said, phentermine is an appetite suppressant. It is thought to trigger the release of the chemical norepinephrine in the brain, which increases blood concentrations of leptin, an appetite-regulating hormone. Topiramate, commonly known as Topamax, is prescribed as an anticonvulsant and migraine medication. It can aid in weight loss by increasing the feeling of being full, making foods taste less appealing and increasing calorie expenditure. As you can imagine, together these two drugs can pack a powerful punch against the battle of the bulge. Who is Qsymia designed for? It will be available in a standard dose, but also a higher dose for select patients. Women using Qsymia must consistently use an effective method of birth control. If a woman becomes pregnant while using Qsymia, they should discontinue the medication immediately and contact their physician. Who should NOT use Qsymia? Women who are pregnant, people with eye problems especially glaucoma, people who have an overactive thyroid, people taking a type of antidepressant called MAOI, or people who are allergic to phentermine, topiramate, or any of the ingredients in Qsymia should NOT use the drug. How should Qsymia be used? Qsymia is designed to be used in combination with a healthy lifestyle, including a reduced-calorie diet and exercise. In clinical trials, Qsymia was only effective when combined with this kind of lifestyle. How long do you have to take Qsymia? Once you begin this regimen, you will have to continue it for the rest of your life, unless you develop a side effect or another reason to discontinue usage. What, if any, are the side effects? The most common side effects are tingling in the hands and feet, dizziness, change in taste, trouble sleeping, constipation and dry mouth. Qsymia can also increase your resting heart rate, affect how you think and is associated with difficulties concentrating. Be aware of such changes and call your health care provider immediately if you experience any of these symptoms. If you have type 2 diabetes, weight loss may increase the risk of low blood sugar. Speak with your physician about this, because he or she might have to adjust your diabetes medications. What have clinical trials shown? Last year, a study funded by Vivus, Inc. In a placebo-controlled clinical trial, those who took Qsymia lost an average of 8. Seventy percent of those taking Qsymia lost at least 5 percent of their body weight compared to only 20 percent of those on the placebo. Qsymia was initially denied FDA approval in because of potential side effects, including heart palpitations and birth defects if taken by pregnant women such as cleft lip or palate. After the current approval process, Vivus agreed to conduct further testing to show that Qsymia does not have dangerous cardiovascular side effects. Clinical trials have already shown that Qsymia can lower blood pressure, reducing the risk of heart attack and stroke. When will Qsymia be available for use? The overall consensus is that the best way to keep off unwanted weight is through a healthy lifestyle, including proper nutrition and exercise. Qsymia can act as the jumpstart that many people need to get on the road to weight loss. As always, speak with your doctor before beginning any diet or exercise regimen. Comments 2 If you come to my house at 8pm each night, you will see three heads huddled over a hard-backed book with several ripped and sellotaped pages thanks to overeager small fingers. You will likely hear my youngest son babble with excitement at certain pages, while the turning of the majority of others prompts my oldest to recite something like the following with perfect diction: Children have that beautiful ability to find something amazing in the smallest things, like in a pile of freshly-fallen autumn leaves or a great big muddy puddle, and with so many of us in a constant battle against the dreaded clock, we could all take a leaf or two from their book. But I digress because while this post could easily be about the wisdom of children! Did you know Chile is some kind of palaeontological paradise?! I also love that it is his interest that is making me learn so much more about this amazing country, as well as the history of Earth itself, and I am incredibly excited to see where this goes. Mapusaurus was a carnivorous predator over 10 metres long that likely hunted in packs, and was named in honour of the Mapuche people. Carnotaurus you may remember him from the Dinosaur movie and the soon-to-be-released, Jurassic World: Right at the bottom of South America is one of the most important sites in South America for fossils. Here you can find the El Puesto excavation site, a place where the dirt crumbles underfoot beside hundreds of fossils. You might find a piece of rib cage here, a femur tip there, while further down whole skeletons have been uncovered. This zone famously contains a 7km field of hadrosaur duck-billed herbivore remains that indicate they were partially burned in a bizarre wildfire. This site, along with others in the area such as Las Chinas and Cerro Guido, provides an unprecedented view into the world of million years ago, a time which previously little was known. What has been discovered in this area is gobsmacking. Titanosaurid sauropods, unique flowers some perfectly preserved and 72 million years old – a feat considering the fragile nature of the petals , the oldest fossilized leaves in South America including oak, lenga, and coihue , 40 types of plants, marine creatures, pollen, wood – A few steps to the left and you may come across marine reptiles, a few spots over you may uncover land mammals of the Cenozoic period. Did you know that the forests of the Cretaceous period that once flourished in Antarctica were almost the same as the forests you can see today in modern day, Valdivia? Here scientists have also been able to study the effects of climate change during the end of the Cretaceous period, including the 25m fall of the sea level over under a million years which allowed a bridge to form between South America and Antarctica. Experts have noted that these bridges were important areas of evolution, giving rise to the new notion that climate change is the unique catalyst of new species. Introducing the Amazing, Chilesaurus, also known as the Missing Link Chilesaurus diegosuarezi is its official name, but most of us will probably remember this unusual dinosaur because of the fact it was discovered in Chile – and the fact that this herbivore is so bizarre that it has been named the missing link between the evolution between herbivores and carnivores. It is also one of the most important paleontological finds in history, believe it or not, with four almost complete and 8 partially complete skeletons discovered. In seven-year-old Diego Suarez discovered the bones while out with his geologist parents near General Carrera Lake, close to the site of breathtaking Marble Caves. What is interesting about Chilesaurus is that it is a theropod, part of the same family as Carnotaurus and Tyrannosaurus Rex, but bizarrely vegetarian. It had a beak, for starters, and flat teeth for plant-eating – curiously still it had fingers rather than claws, while still bearing the famous short arms of carnivores. Unlike the widely criticized National Zoo over on Cerro San Cristobal, Buin Zoo has large enclosures, well-maintained grounds and excellent facilities for the whole family. Expect to see all the classics AND a giant sandpit to hunt for fossils in! Closer to home and Santiago has two events on a limited run. The Santiago Planetarium has a showing of Dinosaurios al Atardecer, which explores the history of dinosaurs around the world Spanish only followed by a fun group activity. This film runs until July 1st. Do take care of your belongings around this metro station as it is extremely busy and be aware that this metro stop does not have a lift or escalator. This is the perfect place to take your child to see huge replicas of their favourite dinosaur, including a dino dig and other fun activities.

Star of the show is the moving, lifelike Chilesaurus, who your child will love. Further afield, in the 6th region to be exact, is the Route of Dinosaur Footprints Ruta de las Huellas de Dinosaurios. At around 100km from Santiago and 70km from its nearest city San Fernando, this is an endeavour for the obsessed or the adventurous but no matter who you are you will be left amazed by the visible footprints left by dinosaurs some million years ago. Standing here, it is hard to imagine that the mountains you see before you used to be sea and that the or so footprints dotted about are visible only due to the ash left by volcanic eruptions all those millions of years before. The earthquake, one of the largest in world history, actually unearthed even more footprints, and the result is a spectacular journey back in time to a Chile that was very, very different. The Monumento Natural La Pichasca is the culmination of a gorgeous drive over azure reservoirs and past miles of grape-laden hills in the Limari Valley, just on the outskirts of the mining town, Ovalle 45 min from La Serena. Pichasca is a long way from anything, so check opening times before you leave. It also gets hot and sunny so pack plenty of water – enjoy! So you Want a Dinosaur Birthday? You will learn all about dinosaurs during some fun activities before Rexy is unleashed on the partygoers cue screams! Eventosaurio is not a cheap birthday rental and Rexy has some big dimensions, therefore needs quite a bit of space to move around, but if your child is dino-crazy like mine, their ecstatic faces make it all worth it. Follow them on Facebook [here](#) and Instagram [here](#). Hope you enjoyed this dino-tastic article! If you are new to my blog, please feel free to have a nose through – I may get a bit honest at times but hopefully you find something that strikes a chord. Age of Ultron , a month after Mad Max: Fury Road, and a good two weeks before Terminator: A still from Jurassic World 22 years on, Isla Nublar has an up and running theme park The official plot summary for the film reads as follows: This new park is owned by the Patel Corporation. It also seems pretty clear that the hybrid will escape from her enclosure during peak season, when the park is packed with tourists. Picture that, but with better graphics and louder screaming. While we quite like the idea of nicknaming her "Dommie", the preferred abbreviation seems to be "I-Rex". The genetic engineers at our Hammond Creation Lab have more than delivered. At first glance, Indominus most closely resembles a T. But its distinctive head ornamentation and ultra-tough bony osteoderms can be traced from Theropods known as Abeliosaurs. And it can reach speeds of 30 mph—while confined to its enclosure. Come experience Indominus Rex for yourself beginning this summer. But for now, it seem as if the filmmakers are holding off on the big reveal, perhaps saving it for a third trailer, or for the film itself. He and the I-Rex definitely have more in common than they think. Bryce Dallas Howard plays a scientist named Claire, who appears to be a key member of the team responsible for creating the dinosaur hybrid: It details how Masrani acquired InGen the company behind the dinosaur cloning technology used in the very first Jurassic Park film , and goes on to state that the future holds "any and every possibility". The Hammond statue will link the film with its predecessors, and provide a nice tribute to the late Richard Attenborough, the actor who played Jurassic Park founder John Hammond in the original Steven Spielberg film. A still from Jurassic World There will be Raptors. However, the trailer scenes of Pratt happily motorbiking alongside a herd of raptors, and conducting some form of in-pen training, suggests that he may well have learnt to marshal the animals. Will we see him lead them in a fight against Indominus Rex? Or is he just teaching them to dance? We particularly enjoyed the shot shown in the rather blurred still below in which one of the creatures was seen swooping down and snapping up a tourist. Just like a chip-stealing seagull.
