Apply complex formatting with a single click. You open a presentation in PowerPoint and it opens as Read-Only. You can only view, print or close the presentation. Possible causes The file is open for previewing in another program Windows Explorer or Outlook can show you previews of your PowerPoint files in their Preview pane. When the Preview pane is open and you select a PowerPoint file to preview, these programs launch a special hidden copy of PowerPoint. You see the preview, but PowerPoint is running invisibly in the background, with the PowerPoint file open. If you then launch PowerPoint and try to edit or save the file, PowerPoint may tell you that the file is in use. By the hidden copy of PowerPoint. The same thing is probably true of any other program that can show you a preview of your PowerPoint files. If you suspect this is the problem, close the Preview pane, restart PowerPoint and try again. It may be faster to close the preview pane then restart Windows before opening the presentation in PowerPoint again. Password-protected file If this affects only some files but you can edit and save other files normally, the author of the file may have saved it with a password that allows you to open but not modify the file. This will be very obvious: If you need to edit the file, contact the author and ask for the modify password or a non-password protected version of the PPT file. The presentation may be marked as Final in PowerPoint or later. Click the Office button, then choose Prepare, Mark as Final again to make it editable again. Presentation is set to Read-Only on disk Once again, this will only affect some files. This might happen because: Someone else is editing the file. Possibly even a previously crashed but still running instance of PPT has the file open. Save the file to a local hard drive under a new name to remove the Read-Only status. Restart Windows to remove any previously crashed or hidden instances of PowerPoint. You can open, view and print presentations, but not edit them. Follow the instructions in the reminder. For example, in PowerPoint , choose Help, Activate from the main menu bar. If the presentation has links to Excel or embedded Excel objects Try changing this Excel setting: Embedded fonts This will only affect certain files, not all of them. See Embedding fonts for a detailed explanation of what this means. Once the Service Pack 2 SP2 or later is installed, or if you use PowerPoint or later, PowerPoint will ask if you want to replace the embedded but unavailable font. Open the presentation and choose Format, Replace Fonts from the main menu bar. In the Replace Fonts dialog box, open the upper list-box to see what fonts the presentation needs. A "TT-in-a-square" icon like the Lydian font in this example tells you that the font is embedded. Fonts with a "? Workaround Here are the best suggestions we have for solving the problem: If the embedded fonts are available, install them on your computer then try opening the presentation again. Have the originator of the file save it again without fonts embedded and send it to you again. If you have an earlier version of PowerPoint available, open the file there, use Format, Replace Fonts to substitute a different font for the embedded ones and resave the presentation. As mentioned above, this may not work in PowerPoint , depending on your service pack level. Open the PowerPoint file in Open Office free , save it under a new name, then open the newly saved file in PowerPoint. Thanks to Rodrigo on the PowerPoint Newsgroup for this one. Let Microsoft know what you think of this "feature". Tell them politely but firmly what it costs you in dollars, embarassment and pain. The presentation may not have Arial Black Italic embedded or even use it, but if Arial Black is embedded, you need to have Arial Black Italic available as well. After opening the presentation and getting a warning about embedded fonts, choose Format, Replace Fonts. If not, try to locate a copy of it. You can also Google on: Did this solve your problem?

A little knowledge of the layout of Adobe Photoshop CC will help you determine if you can easily change saved text. Tip Text that has been flattened with other layers may not be easy to change after a file is saved, particularly if no Undo history is available. Consider text whenever you flatten or merge layers. Identifying Text Layers The easiest way to change text in Photoshop requires only typing over the previous text. However, the text must reside on a text layer. You can identify this by finding the layer in the lower right-hand box on the default screen layout. In more recent versions of Photoshop CC, you can select the text in question by clicking it directly. The appropriate layer is now highlighted on the Layers list. The highlighted layer displays a large T toward the left side of the layer highlight. Select Type tools by clicking the T box. The horizontal type tool is usually the default, but you can right-click the T and select the vertical type tool. Instead of entering text left-to-right, as with the horizontal tool, text appears from top to bottom. Once the appropriate Text tool is chosen, highlight the text you want to change by placing the cursor then clicking and dragging over the text. The selected text is highlighted, and you can type the new text. The selected text is deleted and the new text appears as you type. You can also simply select another tool, such as the Move tool at the top of the tool bar. This permits you to move your text layer into precise position. To create text labels for a multilingual project file, use separate type layers for each element in each language so you can turn layer visibilities on and off instead of altering layers to produce your individual versions. Use "Save As" to create flattened versions of a document that includes text and then save your file in PSD format to retain its editable type. If you click on the type to edit it, Photoshop warns you about the missing typeface and forces you to leave the type unedited or make a font substitution.
