

Chapter 1 : New Countdown Second Edition Teaching Guide 7

New Countdown Second Edition is a carefully structured and graded mathematics course comprising ten books from the two levels of kindergarten to class 8. The pattern followed in the entire series ensures development in all areas of a child's growth through basic, multi-focal knowledge, emphasizing number skills and mathematical concepts.

Then, when I was 15, a new station was launched with imaginative name of Channel 4. The first program to air on this new channel was a game show called Countdown. Countdown is still shown today and is one of the longest running game shows in the World. At the time of writing this article, over 5, episodes have been broadcast. The show was not entirely original in concept, being based on a slightly earlier game shown in France called Des chiffres et des lettres Numbers and Letters. Numbers Game All games require rules, here are the rules for the numbers game of Countdown: Six, face-down, numbered tiles are selected from twenty-four shuffled tiles. The tiles are arranged into two groups: Large Numbers and Small Numbers. At no intermediate step in the process can the current running total become negative or involve a fraction. Each numbered tile can only be used once in the calculation. Some say that only numbers range are generated which are the rules in the French variant , and other say that any three digit numbers is possible. Also, there can only be one each of the larger numbers. In this instance, one number was selected from the large set, and the rest from the small set. There are multiple ways to solve this. The smallest solution requires just four numbers: For 26 years, this host role was performed by the talented Carol Vorderman. Being a numbers geek, I wanted to know many things: Are all problems solvable for a perfect score? Does there exist a three digit number that is not achievable by any combination of digits? If not, what is the hardest number to achieve? Is there a perfect set of numbers that allows the solving of any target ? What is the best strategy? Is it better to take 0,1,2,3 or 4 large numbers? Are there some interesting pieces of trivia found from analysing the problem? ITV Code This was a fun piece of code to write. I elected to use a brute-force approach. There are 13, distinct ways of picking the numbers following the rules. Then, for each of these distinct subsets, the number of distinct ways these numbers can be arranged in order was determined. The most obvious way to process these was to use Reverse Polish Notation to store the calculation postfix as opposed to the more traditional infix.
