To be half as good a father as he was would be a great achievement. I will never be able to teach people in my lifetime what my father taught me by example in one week. Love, Craig In honor of my father. His work in the plastics industry is but a snapshot of a life dedicated to his family. May his ingenuity, creativity, determination, perseverance, and passion be an inspiration for others. I love you Dad, Laura Husband, father, son, brother, friend, dedicated, hardworking, steadfast, persistent, determined, and nowâ€author. Always willing to take on a new challenge, Harold approached each task with enthusiasm, integrity, and perseverance. His love for teaching and sharing his expertise was evident to everyone he came in contact with, from his home life to his work life. He was never too busy to stop and help. Remembering him always with love and admiration, Betty Preface Extrusion processes have long been a staple of the plastics manufacturing industryâ€so much so that the area has been neglected in contemporary reference literature in spite of the advances in applications and productivity that have been taking place in industry over the last decade. While a number of good books about extrusion processes exist, most are not practical for operators or for educational endeavors. A number of books are very theoretical and not practical for engineers or managers. It consists of seven parts, in largely self-contained modular format, that comprehensively and thoroughly cover basic and advanced thermoplastics processing in the extruder. This work is a practical guide, bringing together both equipment and materials-processing considerations. It can be used as a reference for operators, engineers, and managers, or in educational courses. The chapters include information about extrusion equipment, what is happening to the material in the extruder, the extrusion process, setting up temperature profiles, starting up the extruder, extruder operation, extruder safety, auxiliary equipment, troubleshooting, and coextrusion. Each chapter ends with a list of review questions to reinforce the topics. Many chapters have references for further reading. Application examples are employed throughout, and Part 7 is devoted to extended application illustrations of contemporary applications including compounding, blown film, wire coating, and monofilament. Certain parts of this book may best serve the information needs of particular manufacturing companies and university or other training courses. For example, companies concerned with polypropylene profiles would benefit from Parts 1, Single-Screw Extrusion, 3, Polymeric Materials, 4, Troubleshooting, and 7, Extrusion Applications. Companies producing nylon and polyester monofilament will be especially aided by the material in Part 5, Auxiliary Equipment. Companies engaged in compounding color concentrates on a corotating twin screw extruder will find Parts 2, Twin Screw Extrusion, 3, Polymeric Materials, 4, Troubleshooting, and 5, Auxiliary Equipment, of interest. And any company doing coextrusion work will be interested in most of the material throughout. We have learned from him and we trust that others who read and study this comprehensive work will be able to profit from his understanding of extrusion processes too.

Knowledge is the only thing one can give away and still retain. And in the giving, your own knowledge somehow increases. November Table of Contents Part 1: Single Screw Extrusion 1 Extrusion Process. Extrusion Applications 44 Compounding. Single Screw Extrusion 1 Extrusion Process The extrusion of polymeric materials to produce finished products for industrial or consumer applications is an integrated process, with the extruder comprising one component of the entire line. In some applications the production lines are very long with numerous operations, requiring operators to communicate and work together to produce an acceptable finished product. If the extruder temperature profile is set incorrectly, the product ingredients are not properly formulated, the cooling on the extruder feed throat is not running properly, the melt temperature at the end of the extruder is incorrect, the cooling bath temperature is not set correctly, the puller at the end of the line is running at the wrong speed, or any other incorrect operating condition or combinations of conditions, the product may not meet customer specifications. Each step in the process adds value; consequently, the desired product property profile. Some resin systems must be dried prior to extrusion to eliminate polymer degradation due to moisture. Other resins, which do not normally require drying, may have to be dried if they are stored in a cold warehouse and brought into a warm environment, causing moisture to condense on the surface of the pellets, flake, or powder. Once the polymer or blend is properly dried and ingredients mixed, the formulation is fed to the extruder, where it is melted, mixed, and delivered to the die to shape the extrudate. After exiting the die, the product is cooled and solidified in the desired shape and pulled away from the extruder at constant velocity to attain the appropriate cross section. Finally, the product is inspected, packaged, and shipped. Basic extrusion process schematic. An improper setting at the beginning of the process may cause the product to be unacceptable at the end of the line after significantly more value has been added. Speeds of the different process steps must be matched to ensure product compliance. The extrusion process is shown in Figure 1. Polymeric material is received, inspected, and stored. Prior to extrusion, the polymer may be blended with additives stabilizers for heat, oxidative stability, UV stability, etc. Small lots are shipped in or pound bags, and large lots are shipped by tanker truck or rail.
