

Chapter 1 : OHSA Occupational Health Services Australia :: OHSA 00

The GOLD guidelines reflect universal standards in diagnosis and treatment. The ultimate GOLD mission is to increase awareness of COPD. Proper diagnosis and treatment increases the lifespan and.

Chronic obstructive pulmonary disease COPD is an umbrella term that includes a variety of progressively debilitating lung diseases. COPD includes both emphysema and chronic bronchitis. Cigarette smoking causes most COPD around the world. Despite worldwide efforts by health professionals to raise awareness about the dangers of smoking, COPD remains widespread. COPD currently affects as many as 24 million American men and women. However, only half of them are aware they have the disease. By , GOLD filed its first report. Frequent revisions keep GOLD standards up to date. The report advocated an individualized approach to COPD classification and treatment. The most recent update of the report was published in January The GOLD report includes updates rooted in evidence-based medicine. Recommendations integrate important study findings. It also questions whether an intervention improves patient outcomes or quality of life. Consideration of a variety of factors, such as day-to-day symptoms, leads to a more accurate COPD diagnosis. The revision includes the latest standards for medication use. These affect widely used treatments, such as corticosteroids CSs, long-acting bronchodilators BDs, and anticholinergics ACs. The latest study results are reflected in recommended dosages and drug delivery methods. The GOLD committee has determined that this has greatly underestimated the severity of disease. The answers are given point values for a numerical score. Low risk, fewer symptoms Group A individuals have a low risk of future exacerbations. Group A individuals also have zero to one exacerbations per year and have no prior history of hospitalizations for COPD exacerbation. Low risk, more symptoms Group B individuals have the same lung function tests as those in Group A. They also only have zero to one exacerbations per year with no prior history of hospitalization for exacerbations. High risk, fewer symptoms Group C individuals are at high risk for future exacerbations. They experience two or more exacerbations per year and have been hospitalized at least once for a respiratory problem. High risk, more symptoms Group D individuals are also at high risk for future exacerbations. They have similar lung function test results as people in Group C, have two or more exacerbations per year, and have been hospitalized at least once for an exacerbation. Proper diagnosis and treatment increases the lifespan and quality of life in people with COPD. COPD is a complex disease. Many other health conditions can also affect lung function. Talk with your doctor about treatments and lifestyle changes if you have any of these issues:
