Wamback ; Updated April 12, The Heath Company made and sold electronic testing and communications kits between and Their amateur radio Heathkit SB linear power amplifier is still a favorite of ham radio operators worldwide. This amplifier is capable of providing maximum legal radio power of 1, watts or more on all the original amateur radio wavelength bands between 80 and 10 meters, using less than watts of transmitter exciter power. The key to SB operation is a pair of costly Eimac Z triode amplifier vacuum tubes. Carefully load and tune these sensitive final amplifier tubes according to a specific technique to optimize performance and longevity. Connect the Heathkit SB to a resonant antenna and connect a transmitter exciter to the SB via the short coaxial cable. Plug the SB into a volt receptacle. Some units have been modified and rewired for volts; but the manufacturer and manual both recommend a volt power source. Tune up your transmitter as normal to produce about watts. Tune up on an unoccupied frequency, or use a dummy load antenna to prevent on-the-air interference. Reduce transmitter exciter power to zero. Power the SB unit on via the power switch on the front panel. Key your transmitter or place it in tune mode. The plate meter on the amplifier should read 0. Advance the level control until the plate meter shows 0. Alternately adjust the tune and load controls for maximum relative power on the meter. This is called peaking the meter. Advance the drive control until the plate meter reads a plate current of 0. The meter readings should be a plate current of 0. Continue to alternately adjust the tune, load and transmitter drive controls to obtain your desired input power. At 1, watts, plate current should be 0. Adjust the sensitivity control for your desired relative power meter reading. Unkey the transmitter exciter or place its function switch in standby mode until you are ready to transmit. Your station is now ready to transmit continuous wave CW and digital signals. Do not adjust the drive any higher than 0.

Norm is now SK and I wanted post this review of his amp. I purchased this back in from Norm, he had not used it in some years. Still is was clean inside and out and looked like new. I did the usual start up procedure for an amp not used in a long time. Everything was working and output was at spec. Interior build quality was amazing. It looks factory built. Norm was an electrical engineer and his workmanship is outstanding. Since the amp worked so well I saw no need to add mods to deviate from what Heath kit originally designed. Then the high voltage started to drop. So purchased new caps, bleeder resistors, rebuilt the filter board, and installed the soft key kit. Amp is back to full output, I did not buy the expensive caps but caps rated equal to or better and by purchasing the board rebuild parts verses replacing it I saved on that too. I read all the information I could find first. Both from Harbach as well as Rick Measures. Ended up deciding mostly toward what Rick suggested. Though I did not originally assemble the kit it is neat to have a part in keeping this big green machine up and operating as well as making the few small improvements. It makes getting those great reports somehow more satisfying. I find the layout well done, easy to work on and easy to maintain. Support is available as well as parts are easy to obtain. Lots and lots of information out there on the internet too. Highly recommend if you can find a decent example to start with.
