December 18, HTML 4. It offers three variations: Strict, in which deprecated elements are forbidden Transitional, in which deprecated elements are allowed Frameset, in which mostly only frame related elements are allowed. December 24, HTML 4. It offers the same three variations as HTML 4. It expired in May The draft was considered very large at pages and the pace of browser development, as well as the number of interested parties, had outstripped the resources of the IETF. These included extensions to control stylistic aspects of documents, contrary to the "belief [of the academic engineering community] that such things as text color, background texture, font size and font face were definitely outside the scope of a language when their only intent was to specify how a document would be organized. In May , the working group advanced HTML5 to "Last Call", an invitation to communities inside and outside W3C to confirm the technical soundness of the specification. The W3C developed a comprehensive test suite to achieve broad interoperability for the full specification by , which was the target date for recommendation. The concept of a living standard is that it is never complete and is always being updated and improved. New features can be added but functionality will not be removed. It is no longer being developed as a separate standard. The first tag in such a pair is the start tag, and the second is the end tag they are also called opening tags and closing tags. Another important component is the HTML document type declaration , which triggers standards mode rendering. The following is an example of the classic "Hello, World! If a declaration is not included, various browsers will revert to " quirks mode " for rendering. These are indicated in the document by HTML tags, enclosed in angle brackets thus: The text content of the element, if any, is placed between these tags. Tags may also enclose further tag markup between the start and end, including a mixture of tags and text. This indicates further nested elements, as children of the parent element. The start tag may also include attributes within the tag. These require only a single empty tag akin to a start tag and do not use an end tag. These rules are complex and not widely understood by most HTML coders. The general form of an HTML element is therefore: The name of an HTML element is the name used in the tags. If attributes are not mentioned, default values are used in each case. The title is included in the head, for example: Note also that br is an empty element in that, although it may have attributes, it can take no content and it may not have an end tag. The href attribute holds the URL address of the link.
