Compared to earlier programs, VisiCalc allowed one to easily construct free-form calculation systems for practically any purpose, the limitations being primarily memory and speed related. The application was so compelling that there were numerous stories of people buying Apple II machines to run the program. This included the IBM PC when it launched in 1985, where it quickly became another best-seller, with an estimated 1 million sales in the first six months on the market. In spite of these, and others, VisiCalc continued to outsell them all. Unlike Microsoft Multiplan, it stayed very close to the model of VisiCalc, including the "A1" letter and number cell notation, and slash-menu structure. It was cleanly programmed and relatively bug-free, gained speed from being written completely in x86 assembly language this remained the case for all DOS versions until 3. However, because the two video boards used different RAM and port addresses, both could be installed in the same machine and so Lotus took advantage of this by supporting a "split" screen mode whereby the user could display the worksheet portion of on the sharper monochrome video and the graphics on the CGA display. The initial release of supported only three video setups, CGA, MDA in which case the graph maker was not available or dual monitor mode. The ability to have high-resolution text and graphics capabilities at the expense of color proved extremely popular and Lotus is credited with popularizing the Hercules graphics card. The early versions of also had a key disk copy protection. While the program was hard disk installable, the user had to insert the original floppy disk when starting up. This protection scheme was easily cracked and a minor inconvenience for home users, but proved a serious nuisance in an office setting. Starting with Release 3. This was an irreversible process unless one had made an exact copy of the original disk so as to be able to change names if he transferred the program to someone else. Boy, are they looking for ! This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. These were able to not only read files, but also execute many or most macro programs by incorporating the same command structure. Copyright law had first been understood to only cover the source code of a program. After the success of lawsuits which claimed that the very "look and feel" of a program were covered, Lotus sought to ban any program which had a compatible command and menu structure. Program commands had not been considered to be covered before, but the commands of were embedded in the words of the menu displayed on the screen. However, when they sued Borland over its Quattro Pro spreadsheet in Lotus v. Borland, the courts ruled that it was not a copyright violation to merely have a compatible command menu or language. In 1990, the First Circuit found that command menus are an uncopyrightable "method of operation" under section b of the Copyright Act. The menu structure example, slash File Erase was itself an advanced version of single letter menus introduced in VisiCalc. It arrived on PCs with the release of Windows 2. However, Lotus suffered technical setbacks in this period. Version 3 of Lotus, fully converted from its original macro assembler to the more portable C language, was delayed by more than a year as the totally new had to be made portable across platforms and fully compatible with existing macro sets and file formats. The inability to fit the larger code size of compiled C into lower-powered machines forced the company to split its spreadsheet offerings, with release 3 only for higher-end machines, and a new version 2. During the early 1990s, Windows grew in popularity and along with it Excel, which gradually displaced Lotus from its leading position. A planned total revamp of for Windows fell apart and all that the company could manage was a Windows adaptation of their existing spreadsheet with no changes except using a graphical interface. Additionally, several versions of had different features and slightly different interfaces. It intended to expand the rudimentary all-in-one into a fully-fledged spreadsheet, graph, database and word processor for DOS, but none of the integrated packages ever really succeeded. As a result, Microsoft "punished the IBM PC Company with higher prices, a late license for Windows 95, and the withholding of technical and marketing support. Because of this uncertainty, IBM machines were sold without Windows 95, while Compaq, HP, and other companies sold machines with Windows 95 from day one. IBM

stated, "Customers will no longer be able to receive support for these offerings after 30 September. No service extensions will be offered. There will be no replacement programs. Data features included sorting data in any defined rectangle, by order of information in one or two columns in the rectangular area. Justifying text in a range into paragraphs allowed it to be used as a primitive word processor. It had keyboard-driven pop-up menus as well as one-key commands, making it fast to operate. It was also user-friendly, introducing an early instance of context-sensitive help accessed by the F1 key. Macros in version one and add-ins introduced in version 2. Early versions used the filename extension "WKS". Later versions supported multiple worksheets and were written in C.

Last chance to buy this! The power of SmartSuite 9. The most recent release offers nearly 60 new functions and more than 65, rows per spreadsheet. Additionally, release 9. Lotus FastSite A Web publishing tool that enables users to build a complete, customized Web site within minutes. With FastSite, users can quickly and easily convert groups of files from 25 different file formats, including documents created in Microsoft Office and Lotus SmartSuite to HTML and move them to any Internet, intranet, or extranet site with a mouse click. FastSite also includes dozens of pre-formatted, professionally designed Web SmartMaster looks for creating customized sites. In addition, FastSite offers Verity HTML publishing capabilities that allow users to publish documents created in applications that are not resident on their systems. Lotus Word Pro 9. Additionally, Word Pro 9. Freelance Graphics Freelance Graphics users can now read and write presentations within a PowerPoint file without opening the Freelance application. Freelance Graphics gives users a faster, easier way to develop plans, reports and proposals by organizing and summarizing ideas, while simultaneously providing visually compelling documents. Lotus SmartCenter A customizable command center, designed to work like an Internet file cabinet, SmartCenter offers users a simple way to access and organize information from SmartSuite applications, Lotus Notes and the Internet. With built-in Internet content from Yahoo, PC Quote, Intellicast, MapQuest, Travelocity, and other leading Web-based content providers, SmartCenter gives users one-click access to the most updated information they need -- minimizing repetitive, non-targeted Web browsing.
