Back to Product Information Feature: There is only a MIDI out jack on the controller, so if you are using this as a part of a chain it has to be your first thing. I should also mention that I cannot get the controller to send the signal from the damper pedal to anything I hook up with MIDI; I have to hook the pedal up to the device I am using the controller for. Everything is easy to use about the keyboard, but the actual keys themselves are miserable to play on, for a few reasons. First of all, apparently "semi weighted" means sticking a spring under each key. The end result is that the further down you press any given key, the harder it becomes to press. Also, it takes a good deal of effort to keep the keys held down, because there is so much upward force from the springs inside. Its honestly easier to press down the keys of a piano than these keys, and it is certainly easier to hold down piano keys than these. The second problem is that the keys can be pressed much further down than any piano, organ, or synth. I have no idea why they designed the keys this way, because it is really difficult to play softly or quickly on this controller. If you think about how hard it is to press the keys all the way down because of the springs, and then add the problem that the keys have to be pressed down further than a normal keyboard, the end result is an awful keyboard to play on. The final problem is that the black keys are much more sensitive to velocity than the white keys. The same amount of force played on a white key will yield a significantly different velocity signal sent than on a black key. For my M3, each patch I use is based on oscillators that make different sounds at different velocities. Even still, just by listening anyone could easily distinguish between the white keys I play and the black keys. So like I said, this keyboard really is miserable to play on if you are used to playing a piano, organ, or synth. Hard to judge to quality right now, because I have only had mine for about 6 months. However, even though it is only made of plastic, everything seems to be holding up alright so far. I use this controller all over the place, and I usually end up taking it out of my apartment once or twice a week. I have heard that banging on the keys too much will cause them to stop working within a couple of years, but so far I have had no trouble. I definitely bought this controller because it is the cheapest 88 key out there. Its not ugly, but its not really supposed to be sexy either. I only bought this controller because at the time, Korg was only selling the 61 key version of the M3. So I got the tabletop M3 and then bought the only 88 key controller I could find that I could still afford after getting the M3. It is just barely more worth it to me to have all 88 keys and to have to tolerate this terrible controller. I still give it a 6 though, because its not supposed to be a dream to play. It is just supposed to be cheap and usable. But it is barely usable, and still costs more than it is worth.
