Organization and administration of middle school band / Gary Barton ; Developing proper instrumentation for middle school band / Erin Cole ; Recruitment and retention in middle school band / Chip De Stefano ; Mastering the fundamentals: Exercises to develop technique / Charles R. Jackson ; Literature selection / Scott Tomlison ; Teaching and.

Are you a member or veteran of the military? Yes No What are your goals? Some certificate programs may not be available in AZ and TN. Please consult our school catalogs for more information. Electronic Music History How did we get to where we are as electronic producers and performers? From composers of avant-garde noise music to modern DJs and producers of new media, technology in music is ubiquitous. Sound and Hearing Embark on a journey with audio as it travels from a speaker, through the air, and into our ears. Examine the true characteristics of sound as they exist in their environment, as well as their physical and emotional interactions with humans. Harnessing sound and acoustical energy is a lifelong journey. Objectives What Is Sound? Analog vs Digital In this lesson, we move forward on our journey through sound, examining the underlying principles of audio and signal flow in the electrical realm analog as well as inside the computer digital. Understanding the manipulation of audio as the tools evolve over time is a trait shared by the most successful in this industry. At the Recording Connection, tutors are standing by to assist with your workflow, address specific issues, and show you all the ways in which you might customize your Logic environment as well as your home studio to fit your needs as a producer. Music Fundamentals In this chapter, we begin to pull apart the fundamental elements of music itself, such as rhythm, melody, harmony, texture and dynamics. Understanding a few of these rules can go a long way in learning how to break them in new, exciting ways! Step into a commercial studio with you mentor, and see how these tricks apply to recording sessions with other musicians! LESSON 6: Composition and Song Structure Building on our previous unearthing of the elements that make up a piece of music, we discuss the form and structure of these materials, and write some music, too! Through the exercises in our curriculum, the student learns how to use Logic as a rapid tool for writing, and begins to produce a 5-song EP, to be refined with each subsequent lesson in the curriculum. In addition to the lessons, you may take advantage of one-on-one remote study sessions with our in-house team of producers, to further develop the sound in your head. As a production tool, one can use it to compose music without committing to the sound of the instrument, as MIDI is just simple set of messages primarily notes. These messages, generated by hitting a drum pad or keyboard controller, are the DNA to your musical performance, and once fed into a computer, take on many new and exciting lifeforms. Synthesis Discover a plethora of different methodologies for making sounds from scratch! Through careful examination of the building blocks of synthesis, we gain a deeper understanding of the complex sounds we hear on our favorite tracks, as well those inside our heads. Virtual Drums It is finally time to talk about the aspect of the electronic music that most of our students go bonkers over "that is, how to make BEATS!! The beat is the driving force behind a vast majority of repertoire in electronic music. In this chapter, we will discuss the impact that the drum machine and drum software have had on society, as well as how computer drum technology has allowed us producers, composers, and engineers to re-create actual drum grooves synthetically. Samplers Enter the world of sample-based music through an interactive lesson in slicing, chopping and arranging samples, sourced from audio recordings as well as original material. At a basic level, a MIDI effect will take the notes played by your hand and warp them in a variety of ways; the results are ear candy, and arriving at these unexpected treasures makes for an interesting contribution to your music. Using Flex Time in Logic, take multitrack recordings of drums and snap them into place so they groove alongside your sequenced rhythms. Microphones and Tracking Techniques A microphone changes acoustic energy into an electric current that can be altered and manipulated. Any device that converts one form of energy into another form of energy is called a transducer. Microphones are typically the first stop in the signal flow of our recording path.

In this chapter, we will look at various types of microphones, explain briefly how they work, and help familiarize us with popular mics we will see in the studio. Equalization and Dynamic Processing Equalization and dynamic processing are two of the most established and powerful sonic manipulation tools we producers have in our arsenal. Dating as far back as the early years of broadcasting around the time the telephone was invented, equalization and a type of dynamic processing known as compression were used to facilitate the transfer and capture of sounds. Today, we use these mechanisms to achieve overall balance in our sound, or to effect or manipulate audio signals for creative expression. Effects Processing Warp, twist, and mangle recorded sound into sonic bliss or mayhem! Recorded vocals in your closet? Feed them through the Space Designer, which injects your audio into a variety of environments as if they were recorded there, from car interiors to cathedrals to a tin can in the great void of space! Not enough ear candy? Mixing and Automation Dig deep into the art and science of mixing records! Learn how to automate aspects of your production so you quickly arrive at the sounds you hear in your head. As any Mix Engineer will tell you, a classroom and a textbook alone cannot prepare you to deliver great mixes. Mastering In the recording world, a master is a finished product - a song that is fully mixed down and radio ready! Mastering is the art of sweetening the mix and preparing the mixdown for duplication. The goal of this chapter is to familiarize us with some of the very basics about the mastering process. Mastering is a very technical process that often involves specific gear that is calibrated to subtly alter a mix in ways that improve the sonic qualities of a specific song, and ultimately, for multiple songs on an EP or LP. Advanced Synthesis Exercising our previous knowledge of the building blocks of sound synthesis, we will develop our own library of patches, a creative arsenal to take with you as you venture out into the world as a producer. With our production team in Los Angeles, you will dissect the complex sounds you hear on your favorite records and learn how to go about replicating them. Advanced Sampling Create sample-based instruments from your favorite sounds on records, sounds you collect from your environment, even your own music! Chop, slice and warp to your liking, and compile a sample library that only you own! Learn how to make playable instruments from audio samples we collect in our environment, such as a bass made from a coffee grinder, or a syncopated hi-hat pattern derived from water droplets. The final exam, to be taken at the studio with your mentor, will gauge your understanding of the material discussed on the journey thus far, a twenty-week cycle of planting seeds for your lifelong endeavor as an electronic musician, producer, and performer.

Chapter 4 : New Books – Murray State University Libraries

Tell us who you are and we'll point you to resources and information just for you.

Chapter 5 : Wikipedia:Good articles/Social sciences and society - Wikipedia
