If you work extensively with computer and computer data then you should be aware of the various kinds of computer data storage formats. Just as text can be stored in Word documents, the online data exchanging content is best stored in the PDF format.

Oct 18 Interactive prototypes Switch from design to prototype mode with a single click, and connect artboards to communicate the flow and paths of multiscreen apps. Connect design elements from one artboard to another, including Repeat Grid cells. Add interactions with intuitive visual controls to test and validate the experience. Publish prototypes for feedback Generate shareable web links to get feedback on your designs, or embed them on Behance or a web page. Reviewers can comment directly on your prototypes and specific parts of your design. Design for different screens and devices. Pan and zoom without lag time. Choose from preset sizes or define your own, and copy between artboards without losing placement of your design elements. Repeat Grid Select items in your design, such as a contact list or photo gallery, and replicate them horizontally or vertically as many times as you want â€" all your styles and spacing stay intact. Update an element once and your changes will update everywhere. Assets panel Make colors and character styles easily available for reuse by adding them to the Assets panel formerly the Symbols panel , which automatically includes symbols. Edit any color or character style in the panel and the changes will be reflected throughout your document. Reimagined symbols Save time with symbols, reusable design elements that eliminate the need to find and edit each instance of an asset across a document. Symbols can be vector graphics, raster images, or text objects, and they can also be used as objects within Repeat Grids. Modify properties like border color and thickness, fill colors, shadows, blurs, opacity, and rotation, and access options for alignment, dimensions, and Repeat Grid. Smart canvas navigation Easily zoom in on a specific area of your design, or make a selection on an artboard and use a shortcut to zoom right to it. Pan or zoom with your mouse, touchpad, or keyboard shortcuts. And get great performance even if you have hundreds of artboards. Contextual layers Stay organized and focused while managing complex designs thanks to a contextual approach to layers. Layout guidance tools Seamlessly draw, reuse, and remix design elements using snap-to grids and other intuitive layout tools that help you create relative measurements between objects, mask with shapes, group, lock, align, and distribute design elements, and more. Blur effects Quickly blur a specific object or an entire background to change the focal point of your design, giving it depth and dimension. Versatile linear gradients Create beautiful linear gradients using simple yet precise visual controls in the Color Picker. Modern Pen tool Draw shapes and paths easily with the Pen tool. Use custom paths, add or remove anchor points, easily manipulate lines, and switch between curved and angled paths â€" all with the same tool. Boolean group editing Create and experiment with complex shapes by combining groups of objects using non-destructive Boolean operators. Typography styling Style text with precise control to enhance the user experience. Easily adjust typographical elements like font, typeface, size, alignment, character spacing, and line spacing. Change the appearance of your text the same way you change other elements in XD like opacity, fill, background and blur effects, and borders. Streamlined color control Pick colors by entering exact values or by sampling from inside or outside XD with the Eyedropper. Create and save color swatches, and use shortcuts for hexadecimal codes in the Color Picker.

Chapter 2 : How To Password Protect A Pdf In Adobe Reader | www.nxgvision.com

In this tutorial, learn how to protect PDF by using the Protect tool in Acrobat DC to keep your information safe. Keep others from copying, printing and editing the information in your PDF documents with just a password.

There is also the chance that it will slow down your computer, especially at startup. We had previously done a guide on this , but things have changed a lot since then. This updated guide focuses on Yosemite Select "File" in the menu bar. Click on "Set Password. Leave a password hint optional, but suggested. When you open it, it will ask you to enter your password. There is also another way to access the password setup screen that may be a little bit quicker, depending on your workflow. If you want to create a password-protected document in the iCloud version of iWork , hit the "Tools" icon, then "Settings," then "Set Password. Note that this will not work on image files, only PDFs. Open a PDF in Preview. Select "File" in the menu bar, then hold down on the Option key on your keyboard and select "Save As. Check the "Encrypt" box below the Format and Quart Filter options. Enter a password and verify it. When you open it, Preview will prompt you to enter the password. Again, this only works for PDFs. When you go to the "Save As" dialog window for pictures, the option to encrypt will not show up. To remove password-protection, simply follow the steps above again, only uncheck the "Encrypt" box, then delete the old password-protected file. From a webpage or document, simply: Go to "File" in the menu bar, then choose "Print. Select "Save as PDF" from the drop-down box in the bottom left. Name your file, then choose "Security Options. To remove password-protection, use Preview see section above. Word for Mac The following method applies only to the version of Word for Mac. See the next method for how to do it in the version. From the menu bar, go to "Word" and click on "Preferences. Enter a password into the "Password to open: You can also choose to place a password to modify the document. Note that there is a character limit. Word will then ask you to reenter your password. Additionally, you can set passwords for letting people modify the document, and you can protect tracked changes, comments, and forms by choosing "Protect Document" in the Security window. To remove password-protection, simply follow the steps again and delete the password on the "Security" window. From the menu bar, go to "Tools" and click on "Protect Document. You can also choose a modify password, and document protection for changes from this menu. To remove password-protection, simply follow the first step again and remove the password from the field. From the menu bar, go to "File" and click on "Passwords. Additionally, you can choose only to password-protect modifications in the presentation. To remove password-protection, simply follow the first two steps again and uncheck the box for "Encrypt this presentation and require a password to open. It is also the same whether in Excel for Mac or Excel for Mac Alternatively, you can choose "Save As" from "File" in the menu bar, then click on "Options" to set passwords in Excel. Just like with Word and PowerPoint, you can choose to have a password for modifications. To remove password-protection, simply follow the steps again and delete the password on the "File Passwords" window. Using Disk Utility for Folders If you want to password-protect other files in Mac OS X, like photos, videos, and music, you can dump them in a folder and use the native Disk Utility feature to create an encrypted disk image of the folder. If you want to encrypt individual files without creating a folder first, see the next section. Choose a folder then click on the "Image" button. Hit the "Save" button. Enter your password and verify it. Uncheck the box next to "Remember password in my keychain. Enter your password, hit "OK," and your folder will open. And make sure to also delete the original folder, since Disk Utility does not automatically delete it after creating a disk image see the next section for a way that will automatically delete it. Using Automator to Simplify the Disk Utility Process Instead of following all of the steps above using Disk Utility each time you want to create a password-protected folder, you can use an Automator action to simplify the process. Not only is this method easier, but it offers two more benefits: Download our Encrypt Image action onto your Mac. Unzip the file and place the Automator action wherever you want I chose my desktop. If you see the following warning, make sure your Gatekeeper settings are configured properly. You will need to allow apps downloaded from anywhere. If you see this, adjust your security settings. Make sure that the options remain as seen below Size: If you want to change one, or both, use the Volume name field for the volume name, and Save as for the. Click

on "Continue" when finished. On the next window, make sure that "Remember password in my keychain" is unchecked, then enter a password, verify it, and hit "OK. The method is different for files vs. Also, my file is on my desktop. If yours is elsewhere, change 2 to the appropriate directory; the ZIP will be created in the same directory. Open up Terminal either from Spotlight or the "Utilities" folder in Applications. Type in cd Desktop and press the Enter key to focus Terminal on your desktop. If your file is in another location, use that directory, or move it onto your desktop first. Now enter the following command: After hitting Enter again, Terminal will ask you to enter and verify a password for the file. For example, if the file was this is mine. After a few seconds, your file will be converted to a ZIP file, encrypted and on your desktop. Open it up to test it out. The process for encrypting a folder is slightly different. For example, if your folder name is Pictures, it would be zip -e Pictures. If your folder has one or more folders contained within, adjust it slightly to zip -er Pictures. Other options include Hider 2: This app uses AES bit encryption. You cannot share password-protected files using this app. This app lets you drag and drop files into their app, which are protected with an AES-Twofish cascade encryption algorithm. Are there other Mac OS X applications out there that you prefer? Let us know in the comments below.

Once Notepad is open, type your name into the untitled document. Highlight your name by dragging the mouse pointer across it while holding down the right mouse button. Your name will be highlighted and have a dark grey background around it. From the Menu, select the option to. Either way, the text can now be copied to the Windows clipboard and pasted into other applications. A word of warning: Close the Notepad program. For this activity, do not save the document. Open the Microsoft Word Program. Once the Program is open, se lect the menu and then. Your name should now be pasted into the Word Document. The above activity was a simple exercise in copying data from one application to another using the clipboard. You can also copy data from a spreadsheet to a word processor document and retain the table features of the data. Activity 2 â€" Copy and paste a table between applications. Open the spreadsheet in Exce l. The document is a simple home budget that has some figures and uses spreadsheet formulas to calculate various figures. Highlight the range of cells from A1: Open the Microsoft Word program. Select the menu and then. The data should now be pasted into the Word document and the table formatting retained. If you cannot see the gridlines for the rows and columns, select the menu and the option. Note that when the data has been pasted, the formatting has been pasted as well. For example, you should see the green background colour of the heading, the bold attributes, and that the total figure for February is in red. Also notice that the total figures are now actual figures and not formulas as they were in the spreadsheet. Exercise 1 Download the widgets. The exercise and activity co mpleted above can also be completed in reverse - you can copy and paste a table from Word to Excel. When the data is pasted, the values in the table columns and rows are kept the same as in the cells within Excel. This should select the table that holds the data. Depending on the version of Word you are using, there will be a box with a cross in the top left of the table area. Click on the cross or drag across the table while holding the right mou se button. This will select the data within the table. Use the techniques learned before and copy the table to the Windows clipboard. Select cell A1 and then use the techniques learnt before and paste the data into cell A1. You will notice that Excel will copy and place the individual items into cells as per the table in the Word Document. You could now use the functions of the spreadsheet to calculate the totals, widen columns and so on. As an exercise, enter formulas into row 14 to add the total number of rabbits for each year. Save the Excel spreadsheet as Rabbits. Exercise 2 Download the Depreciation. Open the document and copy and paste the table from Word to Excel. Once you have pasted the data, enter formulas to calculate the closing value. Copy and paste these into Excel. Cutting and pasting data between applications You can cut and paste data between applications, as well as copy and paste. The procedure for cut and paste is exactly the same as copy and paste. Instead of selecting from the Edit menu, you select. Exercise 4 Redo exercises 1, 2 and 3. However, instead of copying the data, cut the data from the source documents. Note that the activities and exercise above can be completed using any Windows application. You have probably copied data between various application programs such as Excel and Word. If the source data changes, then you may need to copy and paste the data again to the destination document to keep the information up to date and correct. Unfortunately, if you change the source data many times, the copy and paste tasks also need to be completed many times. To overcome this problem, Windows applications such as Excel and Word allow data to be pasted as an OLE object linked and embedded. Linked objects When you paste an OLE object, the data is linked so that a change in the source data will automatically update the destination document with the changes. There are two sheets in the workbook. One holds the data on the Rabbits and the other is a chart tha t graphs the rabbit populations for the years and This should display the chart. The chart area is the white area around the chart. When this is clicked you should notice small black squares called ha ndles around the chart area. These indicate that you have selected the chart. Use the techniques learned before and copy the chart to the clipboard. Open Microsoft Word and check that you have an empty document. A dialog box will appear on the

screen. Your computer system knows that the object in the clipboard is a chart object and presents this option to you. This will paste the chart into the Word document. A link has been created back to the source document Rabbits. Note that the chart shows NSW as having the most rabbits for the two years. You will now prove that the link works. Return to Excel an d select the workbook. Change the figure for the NSW rabbits for from 9 to 5 Note that this will change other figures in the spreadsheet. Click on the tab in the Spreadsheet. Notice that the chart has now changed. The vertical graphic bars for NSW are now lower than the bars for the other states. Return to your Word document and check the chart within that document. I t should now reflect the fact that the data has changed in the source document, the spreadsheet. Embedded objects When an object such as a spreadsheet or chart is pasted into another program and the object is linked, the object becomes embedded within the destination document. This means that you can open the destination document, double click on the object and it will open the associated object in the source program. Activity 5 â€" Embedding objec Open the Rabbits. Select the area of the spreadsheet from A3: F15, the area that holds the rabbit data. Use the techniques learned earlier to copy and paste the data into a new Word document. Once the data has been pasted into the Word document, save it as rabbit. Close both the rabbit spreadsheet and the Word document. Now re-open the rabbit document. The rabbit table should be inside the document. Double click the table in the Word document. This should open Excel and also open the Rabbits. You could now make changes to the spreadsheet as required and the changes would be reflected back in the chart in the Word document. This shows how an object can be linked and embedded within other program applications. The exact definition for OLE is having code from one program running inside another program. Export the chart to a Word document as a linked and embedded object. Save your Word document you can think of a name. Close the spreadsheet and Word program. Open the Word program and double click on the chart to open the Excel program.
