

### Chapter 1 : reportviewer - Missing Microsoft RDLC Report Designer in Visual Studio - Stack Overflow

*I did delete the www.nxgvision.com and import the package in it and didn't work!, and now I delete the report from www.nxgvision.com and start a new one with the template but still when I drag a static text on the section RF and write hello in it, I will see "not found" at the print out.*

The partner was unable to find an explanation of the errors on the Internet and so I thought I would explain what the errors mean and provide some best practices to avoid these issues in the future. The Errors The error messages shown in the screenshot below included: In our case the package was exported from a system with GP installed in the F: The second message "Unable to resolve reference to Format" can be caused when a custom format has been manually added in the report writer and used on a report. The issue is that formats are not included in packages and so the format does not exist on the target system. Another "unsupported" option is to use Notepad to edit the package file to change the path for the references to the correct path. Just do a find and replace on the path mentioned in the error message to change it to the correct path. If this was a DLL related issue, we would also need to make sure the DLL file was installed and registered on the target system. If editing the path in a package with Notepad, the backslashes need to be doubled up as a single backspace is used as an "escape" character. To fix the second issue, we could look at the "missing" format in the source system and manually add it to the target system before importing the package. We could also look at using one of the existing built in formats rather than creating a new one. We could change the format used and export the package from the source system again. The Best Practices So what are the best practices to avoiding issues like this causing problems. Here is a list that should help: Export References as individual packages. This way the references can be imported separately on the target system. Any that fail can be fixed by using one of the methods mentioned above. The benefit of having separate packages is that when one fails it does not prevent anything else from loading, which is what happens when the package contains other resources. Also importing references first on a target system ensures that they are in place before another package references them. There are three approaches to exporting packages: Export each resource as a separate package. This is fine for a system with only a few customizations, but becomes unmanageable with a system that has a large number of customized resources. Export each customization as a single package including all the related resources. So if a particular modification included a couple of forms and a couple of reports, you can group these as a single package for that modification. This only works if you know what resources belong to which modification. Export each Product and Type as a single package. This way you can import the customizations back and if anything fails you can work with the smaller subset of the customizations to resolve the issues. Export packages for all the customizations and back them up. These can be restored if they are damaged or lost for any reason. If you are changing any "base resources" formats, messages, strings, etc. This way the changes can be quickly restored if you every need to recreate the custom forms or reports dictionary. Backup the backup files from the points above. Another system is good, offsite is better. Here endeth the lesson.

### Chapter 2 : Report Writing: TOP Tips on How to Properly Write a Report

*[Not Found] is shown only if the referenced field or static text is not properly bound or added to your www.nxgvision.com There can be so many reasons behind this, but to start with, I would want to see the package and let you know of any issues.*

The default behavior is to create a single summarized journal entry. By default, this report prints in summary. To force this report to print in detail, there are two modified reports that are available at the Great Plains Reports Library located at: After that is completed, you must also grant access to the modified report. After those reports and the dex. The reports will provide: Forces the runtime engine to display a dialog box for any assertion that fails. Without the switch you can only choose Courier, Helvetica, Times or System. If it finds a font in the Dex. This is the price of using this particular undocumented feature. This setting is only supported on version When you get that message that says your macro failed on line 65, you can use this to open your macro and jump right to the line of failure for analysis. Another cool thing about this is that it lets you start a macro at any line, no more macro surgery. Also it strips off leading zeros. Test it first before deploying. A user may choose another value from the drop-down list, should he or she want to connect to a different data source. That value will then appear as the default in the predefined Login window the next time that window is used on the current computer. This would give the user 4 login attempts if they accidentally typed in the wrong password. With release 10, only the current encryption will be tried. The default is 15 seconds if this entry is not included in the dex. To cause your application to wait indefinitely for a status code to be returned, set this value to 0 zero. The default is three. Use negative one -1 for an unlimited number of tries. When set to 0 it will wait indefinitely. A valid range of values for this setting are 0 to If this setting is not included, the default value is seconds. INI file will control the period of time Dexterity will wait for a report to generate. If this setting is not included the default value is seconds. Removing all of these settings. Stops named printers from being used on a workstation. LOG that can be used to troubleshoot Named Printers when the program does not use the printer that you specified in the Named Printers Options dialog box. Microsoft Dynamics GP may use the wrong printer even though you specifically changed the printer in the Named Printers Options dialog box. The problem was that the dialog would open and crash any integrations you were running overnight. If a user needs to resynchronize the dictionary, this line should be modified to equal TRUE and then launch Dynamics Utilities. You can now use the following window to specifically select which documents can transfer without doing a Purchase Invoice. It points the combine process where I will go in and debug the TPE. Unhandled TPE was indicating that there was an issue with an exception not being handled when the XML data from Report Writer was being combined with the actual Word template. This allowed Rob and his team to start tracking down the issue with my template from the source code and provide me with an alternate route to solve my problem. As a final note, it seems there is an issue as well with TPE not clearing some process after choosing to remove the exception from the Report Processing Status window. If the setting is set to TRUE, it is full screen. This line would be modified if a user has created an additional location translation in the Location Translation Setup window. Each set determines the location of the main dictionary and its forms and reports dictionaries. TRUE means the field names are not displayed. FALSE means the field names are displayed.

*At this users PC, log into the report writer, find the Financial Trial Balance report in the left hand column and insert it into the modified list. or (3.) Remove the security setting for this user that grants access to the modified report (do this at a PC that is not having the issue - as GP will might a problem removing access to a modified.*

How to re-create the Reports. This article describes how to do this when you use these programs on a computer that is running Microsoft SQL Server. Resolution To recreate the Reports. Export Modified Reports from the current Reports. Select the forms or the reports that you want to export from the current dictionary files. In the Please select a package file dialog box, select the location where you want to save the file, name the package file, and then click Save. Note By default, the package file name is "PackageNumber. A progress bar shows the status of the export. If an error occurs during the export, the error is listed on the screen. Generally, reports that appear in the error list are not exported. Rename the existing Reports. Using Windows Explorer, navigate to the GP code folder. Right-click on the Reports. The file or files may exist on the server or on the workstation. Review the local Dynamics. Import Modified Reports back into the new Reports. In the Import Package File dialog box, locate the package file that you created during the export process, and then click Open. Notes The Import Package File dialog box lists all the resources that exist in the package file. A progress bar shows the status of the import. If an error occurs during the import, the error is listed on the screen. Generally, reports that appear in the error list are imported. However, users may be unable to print the reports. Start Microsoft Dynamics GP. On the Tools menu, click Customize, and then click Report Writer. When Report Writer starts, a new Reports. The Modified Reports list is empty. If the Modified Reports list is not empty, you renamed the wrong Reports. Find the appropriate Reports. In Report Writer, click Import. Click the ellipsis button In the Source Dictionary Reports list, select the modified reports that you want to import, and then click Insert. The reports are listed in the Reports to Import list. When the Reports to Import list is empty, the modified reports have been imported into the new Reports. Note If you created your own table relationships, the table relationships will be removed when you rename the Reports. After you import the reports, the table relationships that you created will be restored. If you created the relationship but did not link the relationship to a report, you must create the relationship again. To recreate the forms.

### Chapter 4 : Report Writer not responding | THWACK

*But, Report Writer is an amazing reporting tool, if only people know how it's structured technically and how to bend it for our requirements. I am not certainly talking about customers. It's the consultants' responsibility to convince customers by demonstrating the power of Report Writer.*

When you run the report, the report processor takes the report definition you have specified, retrieves the data, and combines it with the report layout to generate the report. You can preview your report in Report Builder and publish your report to a Reporting Services report server in native mode or in SharePoint integrated mode, where others can run it. This paginated report features a matrix with row and column groups, sparklines, indicators, and a summary pie chart in the corner cell, accompanied by a map with two sets of geographic data represented by color and by circle size. Jump-Start Report Creation Start with a shared dataset. Shared datasets are queries based on a shared data source and saved to a Reporting Services report server in native mode or in SharePoint integrated mode. Start with the Table, Matrix, or Chart wizard. Choose a data source connection, drag and drop fields to create a dataset query, select a layout and style, and customize your report. Start with the Map wizard to create reports that display aggregated data against a geographic or geometric background. You can also add a Microsoft Bing map tile background. Start your report with report parts. Report parts are report items that have been published separately to a Reporting Services report server in native mode or in SharePoint integrated mode. Report parts can be reused in other reports. Report items such as tables, matrices, charts, and images can be published as report parts. Design Your Report Create paginated reports with table, matrix, chart, and free-form report layouts. Create table reports for column-based data, matrix reports like cross-tab or PivotTable reports for summarized data, chart reports for graphical data, and free-form reports for anything else. Reports can embed other reports and charts, together with lists, graphics, and controls for dynamic Web-based applications. Report from a variety of data sources. Build reports using data from any data source type that has a Microsoft. You can use table-valued functions to design custom data sources. Modify your data by filtering, grouping, and sorting data, or by adding formulas or expressions. Add charts, gauges, sparklines, and indicators to summarize data in a visual format, and present large volumes of aggregated information at a glance. Use parameters and filters to filter data for customized views. Embed or reference images and other resources, including external content. Manage Your Report Save the definition of the report to your computer or to the report server, where you can manage it and share it with others. Choose a presentation format when you open the report, or after you open the report. You can select Web-oriented, page-oriented, and desktop application formats. After you publish the report to the report server or a report server in SharePoint integrated mode, you can configure your report to run at a specific time, create a report history, and set up e-mail subscriptions. Generate data feeds from your report by using the Reporting Services Atom rendering extension. Note Published reports are managed on a report server or a report server in SharePoint integrated mode by a report server administrator. Report server administrators can define security, set properties, and schedule operations such as report history and e-mail report delivery. They can create shared schedules and shared data sources and make them available for general use. Administrators also manage all of the report server folders. The ability to perform management tasks depends on user permissions.

### Chapter 5 : [www.nxgvision.comms](http://www.nxgvision.comms) Namespace

*Report Writer lets you create additional reports that are not found in Membership, Attendance, and Contributions. You can print up to 10 pieces of information (fields) about people in your database.*

How to write the report executive summary This part of a report is usually no more than one page in length, and it includes: The purpose of the report The background of the report Sources of information Conclusions and recommendations Our advice on writing the executive summary: While abstracts are brief summaries that address a technical audience, executive summaries represent report writing in such a way that it could stand on its own and would make sense to a non-technical audience. The purpose or objective of the report Background information e. If possible, include illustrations in your introduction to help readers get a better understanding of the context. Before writing about the purpose, make sure you understand it clearly. For a literature review , try to make comparisons. Introduce two different opinions on a particular topic, and lead up to your point of view or conclusion by using those arguments. How to write the report body The body of the formal report is the main part that includes all the facts and materials essential for understanding the problem. It usually has three sections: Theories , models, and hypotheses: This section is optional, but by providing it, you introduce the theoretical basis for your project. This section is where you describe and illustrate the materials used and give a step-by-step report on how you completed your task. This section summarizes your efforts and gives information about what you discovered, invented, or confirmed through your research. Our advice on writing the body of the report: If you made a mistake during any of your steps, write about it, too. Doing so will show the depth of your research and demonstrate how you corrected the errors. Results should be presented in a straightforward manner. To make the parts of your body paragraphs fit together, give a short summary of every sub-section, leading with a smooth transition from one part to another. How to write the report conclusion The conclusion is the last part of your report writing. Sum up the main points and refer to any underlying theme. If any questions or issues remain unresolved, mention them in the conclusion. Write in a brief, concise manner because your readers are already familiar with your points. Our advice on how to write the report conclusion: Before writing your conclusion, make a draft. Go over your research report , and underline all the important information to be repeated. Your conclusion has to stress the importance of the research. Write a smooth transition from the body to the conclusion. Our advice on writing the report recommendations: A numbered list is always a good idea. How to write the report references List all of the sources of information that you used during your research report writing. Our advice on writing the report references: To keep track of numerous sources, begin writing them down at the very beginning of working on your research report. There is nothing worse than having to go back to look desperately for a certain piece of information. How to write the report appendices In your appendices, include data tables, background calculations, specification lists for equipment used, details of experimental configuration, and any other information that is necessary for completeness but would bog down discussion in the body of the report. Your appendices must each have a footer with a page number. Our advice on writing the report appendices: In the appendices, include any supporting pieces of evidence, such as tables or figures, that do not easily fit in the main body of the report. We hope that you found these report writing tips to be useful! Even though there are many variations of report writing, these tips form a solid foundation for you to start writing any report. Good luck with your report writing, and be sure to check out our blog for other writing tips and ideas for your next assignments!

### Chapter 6 : Working with Text fields in Report Writer – Developing for Dynamics GP

*This technique can also be used when it is not possible to create the table relationship needed to add the report in the Report Writer. It works as long as you can create a query that will uniquely select the data you need based on the data on the report or from the already linked tables.*
