

Chapter 1 : Shock Rattle and Roll - MarketPulseMarketPulse

Loose lips sink ships, and overnight comments in the Financial Times cited Peter Navarro, director of Trump's new National Trade Council and senior trade adviser, who said Germany is using a.

His comments sent the greenback into a tailspin. It appears that no one is safe, friend or foe from the wrath of this new U. Moreover, while I have been in utter shock about the new U. The fact is the Euro as a whole, is a much weaker currency than the standalone Deutsche Mark would be and is making German exports notably cheaper. What was initially viewed as a few stray comments from Peter Navarro quickly cascaded into a dollar rout when the news wires lit up after President Trump stated, Our country has been run so badly, we know nothing about devaluation He then went on to single out Japan and China again. The market viewed this as a classic case of verbal intervention sending newly minted long dollar positions into full unfurl mode. Whether this is nothing more than grandstanding to establish a position of strength before entering contentious trade negotiations, who knows? We are entering uncharted territory on the trade front. Indeed, the mighty greenback has entered February like a lamb and only time will tell if it goes out like a lion. However, one thing is sure; we should expect markets to get whipsawed again and again. Welcome to the Brave New Market of the political headline. Australian Dollar The Aussie remains mired in the. Also with little clarity offered on the U. Fiscal front, the Aussie bulls are content to sit idle. Commodity bloc traders are concerned that much of the speculative run on prices came on the back of Trumponomics, which at this stage is looking like a circumspect proposition. Not even sure a hawkish FOMC can turn the tide during this period of extreme dollar negativity. As an aside Back in , the former president of France, Nicolas Sarkozy, ramped up the political rhetoric on a visit to Washington DC because he was equally alarmed about the U. While these battles have raged behind closed doors for ages, the market is just not used to U. Presidents airing their dirty laundry in public. Needless to say, we should.

Chapter 2 : Shock Absorber Safety - Monroe Shock Absorbers

Elvis Presley CD "Shock Rattle and Roll" "Condition Description" Very Clean mint case & disc looks to have been played once. Shipped right out One Business Day or Less.

His comments sent the Greenback into a tailspin. It appears that no one is safe, friend or foe from the wrath of this new US administration when it comes to trade. The fact is the Euro as a whole, is a much weaker currency than the standalone Deutsche Mark would be and is making German exports notably cheaper. He then went on to single out Japan and China again. The market viewed this as a classic case of verbal intervention sending newly minted long dollar positions into full unfurl mode. Whether this is nothing more than grandstanding to establish a position of strength before entering contentious trade negotiations, who knows? We are entering uncharted territory on the trade front. Indeed, the mighty Greenback has entered February like a lamb and only time will tell if it goes out like a Lion. However, one thing is sure; we should expect markets to get whipsawed again and again. Welcome to the Brave New Market of the political headline. Australian Dollar The Aussie remains mired in the. Commodity bloc traders are concerned that much of the speculative run on prices came on the back of Trumponomics, which at this stage is looking like a circumspect proposition. New Zealand Dollar The NZD wobbled and fell under immediate pressure as the unemployment rate came in above expectations which has will have future implication on the wage component of the CPI down the road. While these battles have raged behind closed doors for ages, the market is just not used to US Presidents airing their dirty laundry in public. Needless to say, we should. Opinions are the authors; not necessarily that of OANDA Corporation or any of its affiliates, subsidiaries, officers or directors. Leveraged trading is high risk and not suitable for all. You could lose all of your deposited funds.

Chapter 3 : Monroe - Information

Vibration Testing: Shake, Rattle, and Roll "No Shock! Vibration testing is one of the key tests that is required in qualification testing. The basic purpose of this test is as follows.

What do shock absorbers do? Essentially, shock absorbers do two things. Apart from controlling the movement of springs and suspension, shock absorbers also keep your tyres in contact with the ground at all times. At rest or in motion, the bottom surface of your tyres is the only part of your vehicle in contact with the road. Despite popular belief, shock absorbers do not support the weight of a vehicle. In more detail Firstly, a little bit of science. Shock absorbers work by taking the kinetic energy movement of your suspension and converting it to thermal energy heat that is then dissipated into the atmosphere through the mechanism of heat exchange. As mentioned, shock absorbers are basically oil pumps. A piston is attached to the end of a piston rod and works against hydraulic fluid in the pressure tube. As the suspension travels up and down, the hydraulic fluid is forced through orifices tiny holes inside the piston. Because the orifices only allow a small amount of fluid through the piston, the piston is slowed which in turn slows down spring and suspension movement. Shock absorbers automatically adjust to road conditions because the faster the suspension moves, the more resistance they provide. Types of shock absorbers Although all shock absorbers do the same job, different types of vehicles and suspension designs require different types of shock absorbers which can appear radically different. No matter the application, all shock absorbers fit into one of three broadly defined types conventional telescopic shock absorbers, struts or spring seat shocks. Conventional telescopic shock absorbers This is the simplest type of shock absorber and is generally replaced rather than repaired. This type of shock absorber can be found on both front and rear suspension systems and is relatively inexpensive. Strut type shock absorbers Although they do the same basic job, struts replace part of the suspension system and must be more ruggedly built to cope with greater loads and forces. Although most commonly seen on the front and rear of small to medium cars, larger cars are now tending towards strut based suspension design. The strut category is further divided into sealed and repairable units. As the name suggests, sealed units are designed to be fully replaced, whilst repairable McPherson struts are able to be fitted with replacement strut cartridges. Spring seat shocks The spring seat type shows characteristics of both telescopic and strut type shock absorbers. Like struts, a spring seat shock is a suspension unit and damping device in a single unit. Unlike struts however, they are not designed to be subject to high side loads. Built using similar components to conventional shock absorbers, spring seat shocks are also sealed requiring full replacement. Testing, testing and testing. Shock Absorber safety Shocks and struts are key components of the suspension system. Replacing worn or inadequate shocks and struts and thoroughly inspecting the entire suspension system will help to maintain good vehicle safety and control. So, what are the signs of worn shock absorbers? Although the best way to test your shock absorbers is through a workshop and road test by a qualified technician, there are some very distinctive signs of excessive shock absorber wear and tear you can keep an eye out for. Depending on the type of shock absorber fitted to your vehicle, they may need replacing or repairing. Nose-diving and swerving If the bonnet of your car dips when you brake or slow down, or your vehicle swerves under brakes, you may have a shock absorber problem. Bad vibes Uncomfortable steering wheel vibration could be shock absorbers. Not hugging the bends? Time to get those shock absorbers checked then! How long do shock absorbers last? The way you drive, where you drive, what you drive, the loads you carry, the weather many things can impact on shock absorber life - so there is no hard and fast answer to this question. However, Monroe and other leading automotive experts recommend that you have a trained specialist inspect your shock absorbers for signs of wear every 20,km. The Safety Triangle 3 sides to safer motoring Shock absorbers, brakes and tyres are essential to your motoring safety. Steering Worn shock absorbers can cause your tyres to lose contact with the road dramatically affecting steering.

I suppose that I could just take the impressive claims at face value, and go with testimonials about how great the product is. However, skeptic that I am, I thought that I might look into the claims and see what the evidence has to say about them.. I do think it would be rather closed-minded of me, actually, to simply dismiss the device out of hand. Asking your horse to stand a jiggling plate would not seem to jump out as a way to health and prosperity, so to dismiss the whole thing out of hand might be understandable. So, here we go. Coming soon to a street near you The first thing that jumps out is that exactly none of the claims made in the ad " zero, zilch, nada " are supported with any references. That is, the ad is asking you to swallow the claims being made at face value. While that might be a persuasive approach to some people, to others like me they are the medical equivalent of claiming that you just saw a Tyrannosaurus Rex walking down the middle of your street. What the horse has is what it gets. Still " back to the T. And I searched for studies on vibration therapy in horses. It was published in the Polish Journal of Veterinary Science a journal to which I do not subscribe back in It studied the effect of vibration plates on a variety of blood measurements. So I clicked on that. Even though they state that there are over peer-reviewed scientific studies on the Theraplate, they list 13, which is OK, I guess. However " and I have to say that this bugs me " exactly NONE of the studies have anything to do with horses. The Effect of 30Hz vs 50Hz passive vibration and duration on skin blood flow in the arm. Vibration at a certain wavelength produces increases in skin blood flow in people. And may help in diabetes. Whole-body vibration may be a potential warm-up procedure for increasing vertical jump height. This effect was shown in one of 4 muscle groups studied. Calls for more research. A Randomised Controlled Trial. Efficiency of vibration exercise for glycemic control in type 2 diabetes patients. Effect of 6-month whole body vibration training on hip density, muscle strength, and postural control in postmenopausal women: Vibration therapy might help with balance and hip mineral density in post-menopausal women. Whole body vibration as an adjunct to static stretching, College students who stretched their hamstring muscles were able to get a little bit more stretch if they used vibration plates. Well, let me back up just a bit. Effects of 6 weeks of periodized squat training with or without whole-body vibration on short-term adaptations in jump performance within recreationally resistance trained men. OK, but, seriously, what about comparing them to people who trained without the plate, rather than those who sat on couches and ate souvlaki? The whole thing strikes me as really curious. It was a big fad a few years back. Not so much anymore. Oh, one last thing. Take a look at this article, in the blog Science-Based Medicine. When it comes to exercise, who likes to do that more than horses? Right now, they are just one more instance of putting a jiggly therapeutic cart in front of the horse:
