

Chapter 1 : Editions of Tales of Two Countries by Alexander L. Kielland

Tales of Two Countries has 4 ratings and 0 reviews. Work from one of the most famous Norwegian authors of the nineteenth century.

Please bear with us during our website upgrades and enjoy selected posts from our archives. Democrats have secured more than enough seats to retake the majority in the House of Representatives; 2. Democrats flipped seven governorships including one held by the dread pirate Scott Walker in Wisconsin. From the start it was clear that Democrats had set their sights on the House. The list of candidates they fielded was diverse and strong, a stark contrast from previous election cycles. And, surprisingly, their messaging was disciplined. They ran on ostensibly two issues: Regarding the former they were helped tremendously by a GOP that had spent the better part of the last eighteen months doing their best to strip away protections against preexisting conditions. As for the latter, once again Dems were helped by House Republicans who during most of the last two years virtually rubber-stamped every malfeasance that came out of this White House. Clearly, a majority of the people who showed up at the polls in these districts want some kind of check on this administration. Impeachment, no; oversight, yes. However, this wave “if you can call it that” bears little resemblance to the one that Republicans had in . In fact, you could say it was the polar opposite. In , the Tea Party wave that swept Democrats out of the majority in the House and almost claimed the Senate was about as far to the right as any movement the country had yet seen, including the infamous Gingrich revolution in the midterms. With a few exceptions, most of Democratic winners last night were moderates. I know because I live in suburban America, where most of these races were held, and I can assure you that it is not a bastion of liberalism. Something for the next Speaker to consider in the coming weeks. But while winning the House was an accomplishment, the results in the Senate races were a sobering reminder of just how daunting a task Democrats had and will continue to have in their quest to regain the majority. All that aside, what we saw from the Senate results was a microcosm of what has happened to the country. Take Florida, for example. But apart from those areas, the majority of the rest of the state was one gigantic sea of red. It was as if we were seeing a repeat of the election, and not just in Florida. In every state that had similar geographic breakdowns, the results were the same. The only blue dog Democrats to survive the night were Joe Manchin of West Virginia and Jon Tester of Montana; and in the case of Tester, only a late surge of ballots saved him. He looked like a goner earlier this morning. The ad that he put out about a caravan of migrants over a thousand miles away, which most of the networks “even Fox News! Going into the election, the polls showed McCaskill ostensibly in a tie, and both Donnelly and Nelson with small but consistent leads. As of this writing, only Nelson, is still technically alive by virtue of a mandatory recount. However, it is doubtful he can overcome a 30, vote deficit. Not since the Reconstruction era have we seen such a deep and corrosive divide within the electorate. If anything, we are more entrenched now than we were 24 hours ago. I fully expect Rosenstein to either quit or be fired in the next few days. I have been saying for months that Trump wants to end this investigation; with Whitaker in place, he now has the means to do it, or at the very least cripple it. This man has no regard for anything or anyone; his contempt for the rule of law holds no bounds. He will fight House Democrats tooth and nail all the way to the Supreme Court, where his new BFF, Brett Kavanaugh, may well cast the deciding vote on whether this Republic lives or dies. If you really want to know why Trump went to the mat for this guy, this is why. So what should House Democrats do? Any attempt to equate the two is obscene and offensive to anyone with half a brain. They can start by removing the cap on SALT payments and restoring the personal exemptions that were stripped away in the law. They can pass a real bill that improves border security while providing a pathway to citizenship for the millions of people who are here through no fault of their own. Voters gave Dems the majority expecting something. Being the party of No, like Republicans were during the Obama years, may be tempting for a few in the party, but as a long-term strategy, it will cost them their majority and any hope they have of winning back the White House in . Basically, Democrats will have to learn to walk and chew gum at the same time. They must be as tough as possible with this lawless president, while making it clear to the electorate that they are focused on accomplishing things

while in office. I believe so long as Dems take care of their side of the street, they will be rewarded handsomely by the voters in the long run.

Tales of Two Countries (Dodo Press) [Alexander L. Kielland, William Archer, H. H. Boyesen] on www.nxgvision.com
**FREE* shipping on qualifying offers. Work from one of the most famous Norwegian authors of the nineteenth century.*

Didunculus strigirostris tooth-billed pigeon A similar cladogram was published in , inverting the placement of *Goura* and *Dicunculus* and including the pheasant pigeon *Otidiphaps nobilis* and the thick-billed ground pigeon *Trugon terrestris* at the base of the clade. Parish proposed that the dodo and Rodrigues solitaire should be placed in the subfamily Gourinae along with the *Goura* pigeons and others, in agreement with the genetic evidence. Therefore, the ancestors of both birds probably remained capable of flight for a considerable time after the separation of their lineage. This in turn supports the hypothesis that the ancestors of those birds reached the Mascarene islands by island hopping from South Asia. It was only slightly smaller than the dodo and the solitaire, and it too is thought to have been related to the crowned pigeons. Here they varied The meaning may not have been derived from penguin the Portuguese referred to them as "fotilicaios" at the time , but from pinion , a reference to the small wings. Some ascribe it to the Dutch word *dodoor* for "sluggard", but it is more probably related to *Dodaars*, which means either "fat-arse" or "knot-arse", referring to the knot of feathers on the hind end. The name "*dodar*" was introduced into English at the same time as *dodo*, but was only used until the 18th century. Nevertheless, some sources still state that the word *dodo* derives from the Portuguese word *doudo* currently *doido* , meaning "fool" or "crazy". In his 18th-century classic work *Systema Naturae* , Carl Linnaeus used *cucullatus* as the specific name, but combined it with the genus name *Struthio* ostrich. In , Linnaeus coined the new binomial *Didus ineptus* meaning "inept dodo". This has become a synonym of the earlier name because of nomenclatural priority. The head was grey and naked, the beak green, black and yellow, and the legs were stout and yellowish, with black claws. The bird was sexually dimorphic ; males were larger and had proportionally longer beaks. Weight estimates have varied from study to study. In , Bradley C. Kitchener attributed a high contemporary weight estimate and the roundness of dodos depicted in Europe to these birds having been overfed in captivity; weights in the wild were estimated to have been in the range of The upper bill was nearly twice as long as the cranium, which was short compared to those of its closest pigeon relatives. The openings of the bony nostrils were elongated along the length of the beak, and they contained no bony septum. The cranium excluding the beak was wider than it was long, and the frontal bone formed a dome-shape, with the highest point above the hind part of the eye sockets. The skull sloped downwards at the back. The eye sockets occupied much of the hind part of the skull. The sclerotic rings inside the eye were formed by eleven ossicles small bones , similar to the amount in other pigeons. The mandible was slightly curved, and each half had a single fenestra opening , as in other pigeons. The neck had well-developed areas for muscle and ligament attachment, probably to support the heavy skull and beak. On each side, it had six ribs, four of which articulated with the sternum through sternal ribs. The sternum was large, but small in relation to the body compared to those of much smaller pigeons that are able to fly. The sternum was highly pneumatic , broad, and relatively thick in cross-section. The bones of the pectoral girdle , shoulder blades, and wing bones were reduced in size compared to those of flighted pigeon, and were more gracile compared to those of the Rodrigues solitaire, but none of the individual skeletal components had disappeared. The carpometacarpus of the dodo was more robust than that of the solitaire, however. The pelvis was wider than that of the solitaire and other relatives, yet was comparable to the proportions in some smaller, flighted pigeons. Most of the leg bones were more robust than those of extant pigeons and the solitaire, but the length proportions were little different. The pelvic elements were thicker than those of flighted pigeons to support the higher weight, and the pectoral region and the small wings were paedomorphic , meaning that they were underdeveloped and retained juvenile features. The skull, trunk and pelvic limbs were peramorphic , meaning that they changed considerably with age. The dodo shared several other traits with the Rodrigues solitaire, such as features of the skull, pelvis, and sternum, as well as their large size. It differed in other aspects, such as being more robust and shorter than the solitaire, having a larger skull and beak, a rounded skull roof , and smaller orbits. These records were used as guides for future voyages. Blue parrots are very

numerous there, as well as other birds; among which are a kind, conspicuous for their size, larger than our swans, with huge heads only half covered with skin as if clothed with a hood. These birds lack wings, in the place of which 3 or 4 blackish feathers protrude. The tail consists of a few soft incurved feathers, which are ash coloured. Nevertheless their belly and breast were of a pleasant flavour and easily masticated. First here only and in Dygarrois [Rodrigues] is generated the Dodo, which for shape and rareness may antagonize the Phoenix of Arabia: It is reputed more for wonder than for food, greasie stomaches may seeke after them, but to the delicate they are offensive and of no nourishment. The halfe of her head is naked seeming couered with a fine vaile, her bill is crooked downwards, in midst is the thrill [nostril], from which part to the end tis a light green, mixed with pale yellow tincture; her eyes are small and like to Diamonds, round and rowling; her clothing downy feathers, her train three small plumes, short and inproportionable, her legs suiting her body, her pounces sharpe, her appetite strong and greedy. Stones and iron are digested, which description will better be conceived in her representation. They have been attributed to the professional artist Joris Joostensz Laerle, who also drew other now-extinct Mauritian birds, and to a second, less refined artist. The general opinion of scientists today is that many old European depictions were based on overfed captive birds or crudely stuffed specimens. It is housed in the Natural History Museum , London. The image shows a particularly fat bird and is the source for many other dodo illustrations. Petersburg in the s shows a dodo along with native Indian birds. Iwanow and dodo specialist Julian Hume regard it as one of the most accurate depictions of the living dodo; the surrounding birds are clearly identifiable and depicted with appropriate colouring. The bird depicted probably lived in the menagerie of Mughal Emperor Jahangir , located in Surat , where English traveller Peter Mundy also claimed to have seen two dodos sometime between and Differences in the depictions led authors such as Anthonie Cornelis Oudemans and Masauji Hachisuka to speculate about sexual dimorphism, ontogenic traits, seasonal variation, and even the existence of different species, but these theories are not accepted today. Because details such as markings of the beak, the form of the tail feathers, and colouration vary from account to account, it is impossible to determine the exact morphology of these features, whether they signal age or sex, or if they even reflect reality. According to this claim, the gaping nostrils often seen in paintings indicate that taxidermy specimens were used as models. Though the wings were small, well-developed muscle scars on the bones show that they were not completely vestigial , and may have been used for display behaviour and balance; extant pigeons also use their wings for such purposes. Though some dodo bones have been found with healed fractures, it had weak pectoral muscles and more reduced wings in comparison. The dodo may instead have used its large, hooked beak in territorial disputes. Since Mauritius receives more rainfall and has less seasonal variation than Rodrigues, which would have affected the availability of resources on the island, the dodo would have less reason to evolve aggressive territorial behaviour. The Rodrigues solitaire was therefore probably the more aggressive of the two. This view is supported by the fact that the Mare aux Songes swamp, where most dodo remains have been excavated, is close to the sea in south-eastern Mauritius. Work at the Mare aux Songes swamp has shown that its habitat was dominated by tambalacoque and Pandanus trees and endemic palms. Before humans arrived, Mauritius was entirely covered in forests, but very little remains of them today, because of deforestation. Extinct Mauritian reptiles include the saddle-backed Mauritius giant tortoise , the domed Mauritius giant tortoise , the Mauritian giant skink , and the Round Island burrowing boa. Some plants, such as Casearia tinifolia and the palm orchid , have also become extinct. The document uses word-play to refer to the animals described, with dodos presumably being an allegory for wealthy mayors: They presented themselves with an unyielding, stern face and wide open mouth, very jaunty and audacious of gait. They did not want to budge before us; their war weapon was the mouth, with which they could bite fiercely. Their food was raw fruit; they were not dressed very well, but were rich and fat, therefore we brought many of them on board, to the contentment of us all. Its feeding habits must have been versatile, since captive specimens were probably given a wide range of food on the long sea journeys. France Staub suggested that they mainly fed on palm fruits, and he attempted to correlate the fat-cycle of the dodo with the fruiting regime of the palms. In extant birds, such as frugivorous fruit-eating pigeons, kinetic premaxillae help with consuming large food items. The beak also appears to have been able to withstand high force loads, which indicates a diet of hard food. This gave the dodo a good sense

of smell, which may have aided in locating fruit and small prey. About , as I walked London streets, I saw the picture of a strange looking fowle hung out upon a clothe and myselfe with one or two more in company went in to see it. It was kept in a chamber, and was a great fowle somewhat bigger than the largest Turkey cock, and so legged and footed, but stouter and thicker and of more erect shape, coloured before like the breast of a young cock fesan, and on the back of a dunn or dearc colour. The keeper called it a Dodo, and in the ende of a chymney in the chamber there lay a heape of large pebble stones, whereof hee gave it many in our sight, some as big as nutmegs, and the keeper told us that she eats them conducing to digestion , and though I remember not how far the keeper was questioned therein, yet I am confident that afterwards she cast them all again. Contemporary depictions show a large crop, which was probably used to add space for food storage and to produce crop milk. It has been suggested that the maximum size attained by the dodo and the solitaire was limited by the amount of crop milk they could produce for their young during early growth. There were supposedly only 13 specimens left, all estimated to be about years old. He claimed that the tambalacoque was now nearly coextinct because of the disappearance of the dodo. Anodorhynchus macaws depended on now-extinct South American megafauna in the same way, but now rely on domesticated cattle for this service. I have seen in Mauritius birds bigger than a Swan, without feathers on the body, which is covered with a black down; the hinder part is round, the rump adorned with curled feathers as many in number as the bird is years old. In place of wings they have feathers like these last, black and curved, without webs. They have no tongues, the beak is large, curving a little downwards; their legs are long, scaly, with only three toes on each foot. It has a cry like a gosling , and is by no means so savoury to eat as the Flamingos and Ducks of which we have just spoken. They lay on grass which they collect, and make their nests in the forests; if one kills the young one, a grey stone is found in the gizzard. We call them Oiseaux de Nazaret. The fat is excellent to give ease to the muscles and nerves. This led some to believe that Cauche was describing a new species of dodo "Didus nazareus". It was donated by Marjorie Courtenay-Latimer , whose great aunt had received it from a captain who claimed to have found it in a swamp on Mauritius. In , the curator of the museum proposed using genetic studies to determine its authenticity. Some evidence, including the large size and the fact that tropical and frugivorous birds have slower growth rates, indicates that the bird may have had a protracted development period. The study suggested that dodos bred around August, after having potentially fattened themselves, corresponding with the fat and thin cycles of many vertebrates of Mauritius. The chicks grew rapidly, reaching robust, almost adult, sizes, and sexual maturity before Austral summer or the cyclone season. Adult dodos which had just bred moulted after Austral summer, around March. The feathers of the wings and tail were replaced first, and the moulting would have completed at the end of July, in time for the next breeding season. Different stages of moulting may also account for inconsistencies in contemporary descriptions of dodo plumage.
