This language provides the syntax and semantics for creating models of multi-agent systems covering the analysis and design phases of the software development process. It supports a modular agent design approach and introduces the concepts of intra- and inter-agent control. The modeling of the intra and inter-agent control is based on statecharts. The analysis phase builds on the concepts of capability and functionality. AMOLA deals with both the individual and societal aspect of the agents. However, in this paper we focus in presenting only the individual agent development process. This paper shows how companies can use product-centric data to locally represent the interactions with and between their partners. An agent-based interaction modeling language is used to capture these interactions graphically and formally. Moreover, a formal method is introduced that enables partners to automatically construct a global interaction diagram from their local interaction representations. This global interaction diagram improves enterprise interoperability, since it increases overall process visibility. A simple process example is used to illustrate the approach.
