

Chapter 1 : Lisa Vanderpump - Wikipedia

Includes bibliographical references (pages) and index Everyone in New Jersey was arrested today -- The rabbi's son -- The schnookie deal -- You have no idea what you're messing with -- "Do I really want to get in bed with this guy?".

He makes a terrific jogging companion and his love of activity can get you off the couch. He will fill your life and lap with love and laughter. The Schnoodle is loyal like the Schnauzer and fun-loving like the Poodle. Like his Schnauzer parent, a Schnoodle has a protective nature and makes a good watch dog. Schnauzers are solid terriers and tend toward being a bit stubborn and independent but extremely loyal. The Poodle is smart, agile, and active with a high-maintenance coat. He also has an unusual propensity to use his front paws as hands to hold toys and blankets. Unfortunately, some really enjoy digging. Some really enjoy barking, too. Schnauzers sometimes love one person more than the rest of the family, and that trait can carry over to Schnoodles. There are three different variations of both Schnauzers and Poodles, making for a wide range of sizes in the Schnoodle. The larger ones are still relatively uncommon. There is no breed standard for Schnoodles " nor any breed clubs although one is in the planning stages " so as yet their different sizes are simply and loosely defined as Toy, Miniature, and Standard. However, size may make a difference in the personality of this hybrid. A large Schnoodle should have a softer temperament than a Giant Schnauzer, but beware: Understand these differences before deciding which size Schnoodle is for you. When the parents are carefully selected, the Schnoodle is a great dog. If you want the temperament that the hybrid is meant to provide, get a puppy from a responsible breeder who has taken care in selecting the parents. Hybrid vigor can work wonders, but poor parent selection can result in the worst traits of both breeds with none of the good ones. The Schnoodle should have plenty of exercise every day, at least 30 to 60 minutes. Both Schnauzers and Poodles are smart, so this hybrid requires daily mental stimulation as well. A small Schnoodle can do well in an apartment, but the larger Schnoodle does better in homes with fenced yards. Highlights The Schnoodle is a designer breed, the result of Schnauzer to Poodle breedings. There has been an increase in multigenerational breeding, but many litters are from the first generation. Apartments can be good homes for the smaller Schnoodles, but the larger ones do better in a home with a fenced yard. A Schnoodle will require one or two brushings per week as well as regular ear cleaning and nail clipping. Schnoodles are considered to be non- to low shedders and may make good pets for people with allergies. Schnoodles can be high-energy dogs. They require about 30 to 60 minutes of exercise per day. Schnoodles can make excellent guard dogs. They are protective of their families and will defend them with their lives. Schnoodles are very intelligent and need to be mentally and physically stimulated. To get a healthy dog, never buy a puppy from an irresponsible breeder, puppy mill, or pet store. History The Schnoodle was developed in the s, when the interest began to grow in Poodle crosses. The original goal with the Schnoodle was to create a low-shedding, low-dander family dog. The Schnoodle is generally the result of breeding between a Schnauzer and a Poodle, although some breeders have started breeding multigenerational Schnoodles Schnoodles bred to other Schnoodles. Right now there are no breed clubs or standards, but efforts have begun to create both. Schnoodles can come in a variety of sizes, since there are three Poodle sizes and three Schnauzer sizes. The range of possibilities has created an interesting variety of hybrids. Schnoodles have traditionally been small dogs; the introduction of the Giant Schnauzer and Standard Poodle into the mix is relatively recent and produces a dog of a different temperament from the small, cuddly Schnoodle. Size The size of the Schnoodle depends on the size of the parents: If a Standard Poodle and Standard Schnauzer are crossed, then the result could be sizes ranging between both the Miniature Schnoodle and the Standard Schnoodle. This uncertainty is part of the joy of a mixed breed: Like any mixed breed, the variation involved can eliminate guarantees of size. There are three different variations of both Schnauzers and Poodles: Mixing and matching can add up to some interesting ranges and the variety is enticing. However, most Schnoodles tend to be 20 pounds or less. Toy Schnoodles range from 10 to 12 inches in height and weigh 6 to 10 pounds. Miniature Schnoodles range from 12 to 15 inches in height and weigh 13 to 20 pounds. Standard Schnoodles range from 15 to 26 inches in height and weigh 20 to 75 pounds. Personality The well-bred Schnoodle is a wonderfully happy, loyal, and intelligent companion. He enjoys having fun and aims

for a life filled with love and play. A Schnoodle can have a strong temperament but generally is loving and loyal to his people. Socialization helps ensure that your Schnoodle puppy grows up to be a well-rounded dog. Enrolling him in a puppy kindergarten class is a great start. Inviting visitors over regularly, and taking him to busy parks, stores that allow dogs, and on leisurely strolls to meet neighbors will also help him polish his social skills. However, there is a general misconception that hybrid vigor automatically applies to mixed breeds. Health clearances prove that a dog has been tested for and cleared of a particular condition. You can confirm health clearances by checking the OFA web site ofa.com. This is a family of eye diseases that involves the gradual deterioration of the retina. Early in the disease, affected dogs become night-blind; they lose sight during the day as the disease progresses. Many affected dogs adapt well to their limited or lost vision, as long as their surroundings remain the same. These cause opacity on the lens of the eye, resulting in poor vision. Cataracts usually occur in old age and sometimes can be surgically removed to improve vision. This involves the hip joint. If your Schnoodle has Legg-Perthes, the blood supply to the head of the femur the large rear leg bone is decreased, and the head of the femur that connects to the pelvis begins to disintegrate. The first symptoms, limping and atrophy of the leg muscle, usually occur when puppies are four to six months old. Surgery can correct the condition, usually resulting in a pain-free puppy. Also known as slipped stifles, this is a common problem in small dogs. The patella is the kneecap. Luxation means dislocation of an anatomical part as a bone at a joint. Patellar luxation is when the knee joint often of a hind leg slides in and out of place, causing pain. This can be crippling, although many dogs lead relatively normal lives with this condition. It can cause mild or severe seizures that may show themselves as unusual behavior such as running frantically as if being chased, staggering, or hiding or even by falling down, limbs rigid, and losing consciousness. Seizures are frightening to watch, but the long-term prognosis for dogs with idiopathic epilepsy is generally very good. This is a disorder in which the body cannot regulate blood sugar levels, due to improper levels of insulin. Symptoms of diabetes are excessive urination and thirst, increased appetite, and weight loss. Diabetes can be controlled by diet and the administration of insulin. Also known as hypoadrenocorticism, this extremely serious condition is caused by an insufficient production of adrenal hormones by the adrenal gland. More severe signs occur when a dog is stressed or when potassium levels become high enough to interfere with heart function, causing severe shock and death. But if your Schnoodle is on the large side, and had a Giant Schnauzer for a parent, this condition is worth knowing about. Bloat is more common among older dogs. GDV occurs when the stomach is distended with gas or air and then twists torsion. The dog is unable to belch or vomit to rid himself of the excess air in the stomach, and the normal return of blood to the heart is impeded. Blood pressure drops and the dog goes into shock. Without immediate medical attention, the dog can die. Suspect bloat if your dog has a distended abdomen and is salivating excessively and retching without throwing up. He also may be restless, depressed, lethargic, and weak, with a rapid heart rate. Care Although the energy level of the Schnoodle is reflective of the parents, and is therefore variable, expect to exercise your dog for about 30 to 60 minutes per day. Some require less and others requiring a bit more. Schnoodles enjoy brisk walks and make great jogging companions. Schnoodles can adapt to a variety of residences, but take size into consideration. A Toy or Miniature Schnoodle will do well in an apartment, but a larger Standard may not. Ideally, a home with a fenced yard is best for all Schnoodles. Schnoodles can suffer from separation anxiety when left alone for long periods of time. This can lead to barking and destructive behaviors. And once that habit starts, it can be difficult to stop – so nip it in the bud. Feeding Recommended daily amount: How much your adult dog eats depends on his size, age, build, metabolism, and activity level.

Chapter 2 : Two First Borns? Bad Match

If you're going to share your home with a dog, you'll need to deal with some level of dog hair on your clothes and in your house. However, shedding does vary greatly among the breeds: Some dogs.

They have a tendency to be much harder to treat than pests. Diseases in your plants will usually come in one of two major categories: Fungal diseases are often caused by environments that are too damp or humid, or places which lack airflow. Fungal spores float around in the air looking for a suitably damp place to root down and if the environment is right, that suitably damp place might be on your cannabis plant. Bacterial infections are often sneakier and harder to notice. They are spread by a number of different possible vehicles, ranging from insects and humans to rain and unclean soil or substrate. Bacteria can sometimes get into a plant and then leave it mostly untouched unless the plant is weakened by external stresses, at which point they can quickly take down the whole plant. As always, the best defense against disease is prevention. Do your best to create an environment which is healthy for plants and inhospitable for fungus and bacterial growth. Algae Hydroponics systems are water-based, and without proper care, they can become havens for algae. Algae will live on the roots of your plants, and thus deprive your cannabis of the nutrients necessary for the plant to develop properly in a hydroponics system. Not to beat a dead horse, but your best defense is always preventative. Do your best to minimize the potential for algae growth before it occurs by the taking the proper precautions beforehand. Because algae and cannabis have similar requirements of water and light, it can be difficult to do this. The easiest way is to make sure that no light reaches the roots of your plants. Use an opaque, dark material to block out the light. If algae begins to develop, clean it out right away. It eats every part of the plant, not bothering to distinguish between buds and flowers or stalks and stems. The disease prefers a cool but relatively humid environment. The spores can attach themselves to clothing fibers and then release in the grow room if the environment feels appropriate. If all else fails and your plants develop gray mold, there a few different soaps and sprays you can use to help mitigate the damage and treat the plant. Marijuana Plant Protector is the best solution. Read more about Bud rot on marijuana plants Leaf septoria Leaf Septoria also known as yellow leaf spot produces yellow spots on the leaves of your cannabis plants. The yellow spots initially develop on the lowest leaves of the plant and then work their way upwards. In the worst cases of Leaf Septoria, the entire leaf will turn yellow and begin to crumble. If you still have trouble with yellow leaf spot, you can apply baking soda as a reactive measure. Read more about Leaf septoria on marijuana plants Powdery mildew Powdery mildew on marijuana is a spore based fungal problem that can affect both outdoor and indoor marijuana gardens. The spores are transmissible through the air, and being carried by wind means it can be fairly difficult to protect against. Usually, this is when the environment is warm and highly humid. An overcrowded grow room unnecessarily risks damage to your plants. You can recognize powdery mildew by its white color. It will cover the foliage of the plant and inhibit the photosynthesis process. If your plants suffer from powdery mildew, there are a number of safe naturally based sprays you can use including milk and apple cider vinegar to help deal with the problem. Mold control also treat powdery mildew. Read more about Powdery mildew on marijuana plants Fusarium Fusarium on marijuana is another fungal issue. Instead of eating the foliage, however, fusarium damages the root systems of your cannabis plants. Usually fusarium causes wilting in the plant or a more generalized root rot. Like some of the other fungi, fusarium will sometimes lie dormant in the soil for long periods of time, just waiting to strike. The first signs of verticillium wilt are drooping and yellowing foliage. The fungus will also cause the stem to turn a dark brown at the base, where it makes contact with the soil. Root rot can occur both indoors and outdoors, and in a wide variety of substrates, including the water of hydroponics systems. Initial symptoms include wilting of the plant, and a change in the color of the foliage to brown or yellow. When a plant is infected by pythium, the roots will begin to change color and eventually the outer layer of the roots will be shed to reveal stringy, weak inner core. You can help keep your plants root rot free by fastidiously cleaning the hydroponics system and making sure that the substrate drains properly. Remember, preventative care is key! Damping off usually occurs in cannabis seedlings. The plant itself will develop lesions before actually dying entirely. Again, preventative care is the only real way to deal

with damping off and other fungal disease-related problems. Read more about Damping off on marijuana seedlings Thanks for reading. He has worked closely with numerous elected officials who support cannabis law reform, including as the former Campaign Manager for King County WA Councilmember Dave Upthegrove. He has been published by multiple media outlets, and is a former contributor for Village Voice Media.

Chapter 3 : Schnoodle Dog Breed Information, Pictures, Characteristics & Facts – Dogtime

Schnookie's is committed to providing each customer with the highest standard of customer service.

Well, almost all of them. Lisa Vanderpump kicked things off by really articulating how everybody feels about spinning while at a SoulCycle charity event with Kyle Richards and the other ladies. Why do this for 45 minutes? Well, not since ," she said. She also got a new dog named Schnookie and the dog may or may not look like Ken Todd. By the way, did you know she also has a wine bar in her gorgeous house? But she did just kind of say that. And then Kyle called her out. Nothing will ever be resolved on this show. Yolanda also made vague threats about having a lot of dirt up in her vault. I arrived with a great attitude yesterday and proud of myself for making it out of bed and joining you girls. For you to come down on me so hard is beyond my understanding and it left me quite confused. Your lack of compassion is not a pretty look. For drama of course. This was a masterful dramatic stroke to get everybody on the same page. In an attempt to get to know Erika better, Kathryn started asking the singer some questions. Erika opened up about her grandma and cried six tears, apparently and then started talking about how LVP is really a side sniper and gets involved in all the drama, but makes it so everything goes her way. What does Kathryn do with this information? That is how you stir the drama pot though. Before they were Housewives This new info prompted Eileen to get all up in arms about her encounter with LVP in the Hamptons and how she felt LVP never really apologized for that whole question-probing deal. So, everybody said their piece. And that created more pieces. Now for miscellaneous things said in this episode: I shamelessly stay relevant. Period," Rinna also said when talking about her previous strap-on dildo use.

Chapter 4 : Diseases on Marijuana Plants, and How to Treat Them - TheJointBlog

Investigative journalists of the New Jersey Star Ledger Josh Margolin and Ted Sherman's The Schnookie Deal, the true story of the largest corruption scandal in New Jersey with a cornucopia of scoundrels and crooked capers including: handcuffed orthodox Rabbis, legions of corrupt politicians, brokering of human kidneys, money in paper bags.

Loading But what if you are an only child? Who should you marry? An only child is used to being the center of attention. These are very capable people. That can be very hard, especially when they turn the spotlight of their perfection on each other and find some flaws. First borns and onlies have as models their parents who are adults. To be blunt, our parents practiced on them. They were their little guinea pigs. Which is exactly how Linda Shields felt growing up. The year old divorcee was an only child raised predominately by her grandparents. I had anything I wanted when I wanted it. When she married, she was 27 and says she was looking for someone responsible, who would take care of her and provide for her financially. I was tired of taking care of myself because I did it from a very early age. Finding a responsible, mature adult in the husband she chose, Shields married the oldest son of five children. But that level of responsibility began to create problems in their marriage as it turned into control. But despite the eroding marriage, Shields stayed. I was afraid of it. According to Leman, her marriage had some troubling signs to begin with. Namely that her husband, in addition to being the oldest, came from a family with alcoholic parents so the brunt of the child-rearing, as well as the effects of the disease, fell on him. When it comes to dysfunction in the family unit, the question is, of all the birth orders, who takes the hit? Other factors aside, according to studies, the couples with the best chances are those who come from the middle of the pack. And when you get [a middle child] that marries one it often results in a stable relationship where there is not a lot of melodrama. So in terms of marriage negotiation, they are able to get along. They let things roll off the back. But she may tire of that, and have a tough time changing the dynamic as she tries to create more equality in the marriage. You should be looking at and talking about dynamics such as family history, birth order, socio-economic differences. Birth order does matter. Draw a Family Birth-Order Map. I was the baby in the family and felt spoiled, but I have come to realize that always getting my way will hurt our relationship. I was the first born in the family and took on a lot of responsibility early in life, and I can assure you that you can count on me to take responsibility to keep our relationship happy and healthy. Are you currently thinking about divorce? Wevorce is dedicated to changing divorce for good. Learn more about how we can help.
