In a typical design process, there are three stages when you need to merge databases: Merge fill with the top-level design. This read-in converts all the files to OpenAccess format, which takes time and introduces the potential for format translation errors. The fill databases created with DFM tools are then are read back into to the design tool, and merged with the design data. These full-chip database updates typically happen weekly, but sometimes daily. Is there a better way? Of course there is. Dedicated file merge for physical verification That better way is to use dedicated layout file merge functionality that handles format conversions and database merging quickly and efficiently to minimize runtimes. This method offers low memory consumption and fast runtimes. It can be used at all design stages and integrated with many design tools. How much time does this kind of flow save over using a design tool? Using the dedicated file merge method took one minute. Designers can selectively overwrite that IP in the merged file, swapping old for new in a very fast and reliable operation. A dedicated file merge tool speeds database merging, reduces memory consumption, saves disk space by compressing merged files during export, and offers customization like unique suffixes to prevent cell name conflict. Sometimes designers need to rename only those cells whose content differs between databases, reducing the number of cells in the merged design. Are they all actually the same? However, if one or more are different, you want to ensure all unique content is captured. The file merge process detects any differences in the cell contents and applies new names to each different instance Figure 2. Minimize the renaming of cells with a layout file merge tool that renames unique cells with common names Mentor Merging databases can create bottlenecks in the design and verification flow, wasting time and resources and potentially introducing translation errors. You can reduce your design cycle by days with a dedicated database merge flow that easily integrates the results from multiple design tools to ensure consistent and accurate results. For more information on how to get the efficiencies discussed here, read this white paper: Database Management for Design Verification Flows.
