Related Content For further reading, click on the other pieces in our "Work in the Age of Anxiety" package: Rick Wartzman October 16, The question that haunted the post-war industrial tech boom of the s is rising again: Robert Kuttner October 10, At the rate things are going, tens of millions of us could end up as temps, contract employees, call-center operators, and the like. I go in with the dentist and do the operative care like fillings and root canals and bridgework and extractions. I start at 9 A. I work for two practices, three different offices. Youngwood is in the middle, which is a great thing because that saves gas money. I got a raise in the middle of the year so that made a difference. Certain weeks I work more hours than others. One week I could work 25 hours, the next week I could work up to 50 hours. As an year-old who had no idea what they wanted to do with their life, I did what everybody else did: Nothing was my passion. She had no school loans, she loved her job, she had a nice apartment, a nice car. I wanted to make sure that I was able to support myself. So I figured out what I needed to do to get into the program, and I enrolled at the community college. It was honestly so much harder than I thought it was going to be. You have to take three different board examinations. You have to take two written examinations and one clinical. So I took it the third time, and I passed. I worked the entire time. I do have student-loan debt from the one year at John Carroll. My dad paid off most of it. He cashed in his k and paid off all of our loans because we have five kids who all went to college, and he was just sick of the interest, and he knew it was going to crush us. So, now we just owe him the money back. My dominant role here is representation, so I do all of our 3-D modeling, most of our Photoshop, all of the documents that are either used for communicating the grand design of a space or of getting a really quick idea across to the client. Ninety percent of what we do is bars and restaurants. I live four miles from the office. I try to take the bus two or three times a week. As an East Coaster, I really value walking, and I find it super rejuvenating and balancing to have that hour commute. I went to Tufts for undergrad, and I did art history and architectural studies. There was a very big gap between undergrad and grad school. I was traveling the country giving away random promotional materialsâ€”I gave juice away for a couple of years for SoBe. While I was on the road with SoBe, I wound up meeting my eventual wife. I did a summer program at UCLA that is a sort of a crash course in architectural design. My studio instructor from that program wrote me a recommendation to get into UCLA. I think that for a lot of people the appeal of architecture from the outside is really strong. Do you watch Seinfeld? Or, if I stay in the field, I would be less in a design capacity and more in the partner capacity, the partners being the ones that actually go out and get work and get business. In high school, I did an internship at the Cleveland Clinic. I worked with a biomedical engineer there and really got interested in the field. Miami University of Ohio did not have a biomedical engineering program yet, so I did chemical engineering there with a focus in biomedical. I graduated in and took the summer off and then went to Ohio State University. I got my Ph. After I graduated, I did look at industry jobs pretty heavily. My husband has a job in Columbus, and so for ease of everything I tried to find a job here. For industry, they did want people with more experience. Obviously, I worked in a lab for the entirety of my Ph. Here we work in conjunction with several physicians who see patients with muscular dystrophy, so we are very close to the patient in terms of seeing the real impact of our work. Eventually, I do want to move into industry. People tend to come in between 7 and 9 A. It is definitely overwhelming at times, but overall I love it. Luckily, my husband is in a comfortable position. He is in finance for a clothing company. He certainly works his butt off. My dad is a Ph. Both of my parents are from South America. My husband and I want to have kids. Work-life balance is extremely important, so hopefully my husband will not be working hour days. I actually read an article saying that my generation is the first that is not going to be doing better than our parents. After high school, I wanted to go to community college in Morrilton, Arkansas, just to give it a try. I had a full scholarship there. I walked into class, and they wrote binary-number code on the board. Everybody knows all of this. I just stopped showing up. After about half a semester, I left that and

went to work for Arkansas Electric, building substations. After about six months of that, there were enough substations built so they laid our crew off. Then I got done with that job and helped them lay tiles and stuff. I saw all the commercials and stuff. That turned out to be a disaster. I borrowed for all of the tuition. All the equipment was outdated. Nobody else I worked with had a degree. Now I work at Kazi Electrical in Clinton. But I really do like service work. I was in Seattle for a week earlier this year for a job training and loved it up there. Everybody told me that I needed to come down to Oregon. You look like a Portlandian. My little brother was in special education, and my mom would go to his class every single day and notice all these things that were going horribly wrong: She worked a long time to make things better. Seeing my mother advocate for my brother but also for other kids made me fall in love with the thought of teaching and working with kids. I got scholarships to go to Pomona College in Claremont, California. I had a lot of people push me toward Ph. Then in , I moved to Brooklyn and started teaching history at another charter school. Last year, I taught in East New York at a charter school designed for over-age, under-credit kidsâ€”kids who have been in and out of juvenile facilities, in and out of shelters and other social systems and programs. The bureaucracy of the school and the lack of transparency were difficult, and the inability of the administration to respond to the needs of kids was exhausting. I was preparing to teach again this year, but this opportunity arose to develop curriculum and work with teachers on how to integrate technology for both traditional public schools and charter schools. I grew up in Denver, Colorado, where my dad is a geriatrician. Med school was on me, which meant I took out tuition and my living expenses. The year I started, they increased the interest rate, so most of my loans were at about 7 percent, which is huge. My husband is a different situation. His single mom died when he was young, but she had a trust fund for him that covered about two years of medical school. There was a house attached to the trust, and we sold it. Now, it starts the second you graduate medical school. Residency is cheap labor. They have changed it a lot in the last ten years. They have restricted the amount of hours an intern can work in a row to less than 16, and theoretically no resident is supposed to be in charge of patient care for longer than 24 hours straight. I quickly realized that I loved geriatrics, which falls under primary care. It is actually the most needed of all the specialties and is a specialty that has very high job satisfaction. I chose to do an extra year, where I get paid like a resident, in geriatrics.

*Who's Who in America is a book that has become a legend in everyday life; its abbreviated title, Who's Who, has become an idiom. It is many things to many people: one of the finest and most consistently cited reference books in the world, a national institution, and the arbiter of national renown. A.*

US Olympic team uniforms: Nothing to see here, just Hide Caption 1 of 26 Photos: No, these patchwork cardigans featuring Olympic rings and a stars-and-stripes salad were not heinous. Hide Caption 2 of 26 Photos: Aside from perpetuating the Olympic fetish for blazers and tight white pants, the London uniforms caused outrage because they were made in China. Hide Caption 4 of 26 Photos: The year Team U. Hide Caption 5 of 26 Photos: The white jackets, the futuristic lettering, the Kangol-style caps -- these uniforms were so European it hurt. Appropriate since, you know, they were in Europe. Hide Caption 6 of 26 Photos: The triumphant return to the birthplace of the Olympic Games deserved better than this pajama party, frankly. Hide Caption 7 of 26 Photos: Salt Lake City, This year marked the end of the cowboy hat era and ushered in the Age of the Beret. Anthony dollar to anyone who can explain that one. Hide Caption 8 of 26 Photos: Did you know the American populace is actually just one very large square dancing team? Hide Caption 9 of 26 Photos: The Olympics were IN the U. Hide Caption 11 of 26 Photos: Fabulously obnoxious giant scarf that should probably be available for purchase right now? Hide Caption 13 of 26 Photos: But how about these baby blue, acrylic-fiber memories? Hide Caption 16 of 26 Photos: This is also some premium America, and is not at all SAD. That sign is the Yugoslav designation for USA. Hide Caption 17 of 26 Photos: Behind the presidential-candidate neckties is a sea of patriotic neckerchiefs. Wow, remember when we just wore normal-looking clothes? Hide Caption 19 of 26 Photos: You will stay cool and sporty in white tennis skirts. Oh, the bad news? Your top half will be roasting in a blazer and scarf. The Olympics is no place for comfort. Hide Caption 20 of 26 Photos: Way before "boots with the fur" was a thing, they were, well, still a thing. Hide Caption 21 of 26 Photos: Listen, this seriously needs to happen. Hide Caption 22 of 26 Photos: We LET them happen to us, over and over again. Our striped barbershop-quartet hat game was strong. Hide Caption 24 of 26 Photos: This is the latter. Hide Caption 25 of 26 Photos: The black and white photograph really betrays this look. That fur hat was RED. And those ski pants were BLUE. It was a party!

View gallery - 5 images On this day 60 years ago, America became the second country to send a human-made object into low-Earth orbit, with the successful launch of its first satellite – Explorer 1. The launch of Explorer 1 took place against the backdrop of the Cold War between the United States and its adversary, the Soviet Union, which had shocked the world by launching Sputnik 1 into orbit in October of 1957. Space exploration has come a long way. Today, the exploration of the space environment is, at least in certain respects, considered to be an area of international cooperation, but it was once an arena of fierce technological competition, with the pride of entire nations hanging in the balance. The US, fearing in part Russian dominance of space, responded less than four months after the initial Soviet success with the launch of Explorer 1, which was destined to be blasted into orbit atop a converted ballistic missile. Pickering built the Explorer 1 probe in less than three months, as the science payload was being developed by physicist Dr. James Van Allen, who was at the time working at the University of Iowa. The satellite also played host to an array of temperature sensors, and equipment designed to record the number of collisions with tiny micrometeorites. This data was transmitted back to Earth with the help of four whip antennas that formed a single turnstile antenna, and a further two transmitters mounted on the body of the spacecraft. The Jupiter-C launcher was essentially a conversion of the Redstone ballistic missile – a direct descendent of the German V-2 rocket. Both the Redstone and its predecessor, the V-2, were the work of Dr. Wernher von Braun – the father of modern-day rocketry who had been brought over from Germany to the US in as part of Operation Paperclip. Explorer 1 made 12 full orbits of Earth every day at a rate of one per hour. The final transmission from Explorer 1 was received on May 23, 1958, after which the probe fell silent, its batteries depleted. Explorer 1 now has a place in history alongside the Sputnik orbiters pictured above as the starting point for an incredible journey that set humanity on a course to explore the solar system, and to better understand our place in the universe. Since the advent of the space age just a little over six decades ago, humanity has set foot on the Moon, sent probes to orbit nearly every planet in the solar system, explored fascinating natural satellites, visited an asteroid, and set up a crewed habitat in low-Earth orbit, just to name a few highlights. Along the way, the scientists and engineers that made space exploration a reality have invented incredible, revolutionary technologies that have transformed how we live our lives back on Earth. Once again, it has been just a little over six decades since our species went orbital. Who knows where we could be in another 60 years? Scroll down to see a vintage, television report from the United States Army recounting the story of Explorer 1.

Meanwhile, year-old Catherine Deneuve fronts the latest Louis Vuitton campaign. Her neighbour turned out to work for American Apparel, and she was invited to do a shoot. The first set of images included one of her sitting , fully clothed, with her legs wide open. Here, I thought, was rampant ageism. Photographer Nick Knight believes the success of older models is part of a broader cultural change. Why did she agree to the shoot? The shoot was un-rushed, no fashion talk. Fashion is not my strong suit. All are delighted by their longevity in a career in which your adolescence, if not your prepubescence, is usually your prime. But they also want to be like me: In fact, the more you dig, the clearer it becomes that, most of the time, a strict set of rules operates. Visible signs of age remain, for the most part, so shameful that you need to take all possible steps to erase them. Rhodes thinks that to year-old models have it hardest, unsure whether to try to look younger, or to go the older model route. Digital retouching has become the norm, but some models are prepared to take more drastic measures. Selfe thinks the prejudice against larger models is, if anything, greater than that against older ones. In our culture, sexiness in older women is disturbing: Oh, and anything where grandparents are required. Juergen Teller Harriet Close founded her agency, Close Models , specifically to represent older models aged 25 to 82, and is one herself. She says things are changing, albeit slowly. But their website has since been age-cleansed. Even John Lewis, which has flirted with older models, has reverted to youth. Nick Knight says that, while he is frustrated by the slow pace of change, he believes there has been a significant shift since the s. There was a surge in demand last year, after Channel 4 broadcast its Fabulous Fashionistas series. Selfe has never been busier, and says the same goes for her model friends, too. Of course, for many women, the representation of old age is far less important than their actual experience of it. But in the face of all the noise about "the battle against ageing", there are many others who struggle to accept their changing bodies even while they celebrate their growing contentment. For them, the arrival of older models matters. This article contains affiliate links, which means we may earn a small commission if a reader clicks through and makes a purchase.
